# Chapter 1

## Main Page

This is the reference documentation of [the CImg Library](#), the C++ template image processing library. This documentation have been generated using the tool [doxygen](#). It contains a detailed description of all classes and functions of the CImg Library. If you have downloaded the CImg package, you actually have a local copy of these pages in the `CImg/html/reference/` directory.

Use the menu above to navigate through the documentation pages. As a first step, you may look at the list of [available modules](#).

A complete PDF version of this reference documentation is [available here](#) for off-line reading.

A partial translation in Chinese is [available here](#).

You may be interested also in the [presentation slides](#) presenting an overview of the CImg Library capabilities.

## Chapter 2

# Module Index

### 2.1 Modules

Here is a list of all modules:

CImg Library Overview . . . . .	11
CImg<T> : The image structure. . . . .	13
CImgList<T> : The image list structure. . . . .	14
CImgDisplay : The image display structure. . . . .	14
CImgException : The library exception structure. . . . .	14

## Chapter 3

# Namespace Index

### 3.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

<a href="#">cimg_library</a> (This namespace encompasses all classes and functions of the CImg library ) . . .	31
<a href="#">cimg_library::cimg</a> (Namespace that encompasses <i>low-level</i> functions and variables of the CImg Library ) . . . . .	32

# Chapter 4

## Class Index

### 4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

CImg< T > . . . . .	41
CImgDisplay . . . . .	151
CImgException . . . . .	160
CImgList< T > . . . . .	162

# Chapter 5

## Class Index

### 5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">CImg&lt; T &gt;</a> (Class representing an image (up to 4 dimensions wide), each pixel being of type T )	41
<a href="#">CImgDisplay</a> (This class represents a window which can display <a href="#">CImg</a> images and handles mouse and keyboard events ) . . . . .	151
<a href="#">CImgException</a> (Instances of this class are thrown when errors occur during a CImg library function call ) . . . . .	160
<a href="#">CImgList&lt; T &gt;</a> (Class representing list of images CImg<T> ) . . . . .	162

# Chapter 6

## Module Documentation

### 6.1 CImg Library Overview

The **CImg Library** is an image processing library, designed for C++ programmers. It provides useful classes and functions to load/save, display and process various types of images.

#### 6.1.1 Library structure

The CImg Library consists in a **single header file** CImg.h providing a set of C++ template classes that can be used in your own sources, to load/save, process and display images or list of images. Very portable (Unix/X11, Windows, MacOS X, FreeBSD,...), efficient, simple to use, it's a pleasant toolkit for coding image processing stuffs in C++.

The header file CImg.h contains all the classes and functions that compose the library itself. This is one originality of the CImg Library. This particularly means that :

- No pre-compilation of the library is needed, since the compilation of the CImg functions is done at the same time as the compilation of your own C++ code.
- No complex dependencies have to be handled : Just include the CImg.h file, and you get a working C++ image processing toolkit.
- The compilation is done on the fly : only CImg functionalities really used by your program are compiled and appear in the compiled executable program. This leads to very compact code, without any unused stuffs.
- Class members and functions are inlined, leading to better performance during the program execution.

The CImg Library is structured as follows :

- All library classes and functions are defined in the namespace [cimg\\_library](#). This namespace encapsulates the library functionalities and avoid any class name collision that could happen with other includes. Generally, one uses this namespace as a default namespace :

```
#include "CImg.h"
using namespace cimg_library;
...
```

- The namespace `cimg_library::cimg` defines a set of *low-level* functions and variables used by the library. Documented functions in this namespace can be safely used in your own program. But, **never** use the `cimg_library::cimg` namespace as a default namespace, since it contains functions whose names are already defined in the standard C/C++ library.
- The class `cimg_library::CImg<T>` represents images up to 4-dimensions wide, containing pixels of type `T` (template parameter). This is actually the main class of the library.
- The class `cimg_library::CImgList<T>` represents lists of `cimg_library::CImg<T>` images. It can be used for instance to store different frames of an image sequence.
- The class `cimg_library::CImgDisplay` is able to display images or image lists into graphical display windows. As you may guess, the code of this class is highly system-dependent but this is transparent for the programmer, as environment variables are automatically set by the CImg library (see also [Setting Environment Variables](#)).
- The class `cimg_library::CImgException` (and its subclasses) are used by the library to throw exceptions when errors occur. Those exceptions can be caught with a bloc `try { .. } catch (CImgException) { .. }`. Subclasses define precisely the type of encountered errors.

Knowing these four classes is **enough** to get benefit of the CImg Library functionalities.

### 6.1.2 CImg version of "Hello world".

Below is a very simple code that creates a "Hello World" image. This shows you basically how a CImg program looks like.

```
#include "CImg.h"
using namespace cimg_library;

int main() {
    CImg<unsigned char> img(640,400,1,3);           // Define a 640x400 color image
    with 8 bits per color component.
    img.fill(0);                                   // Set pixel values to 0 (color
    : black)
    unsigned char purple[] = { 255,0,255 };        // Define a purple color
    img.draw_text(100,100,"Hello World",purple);  // Draw a purple "Hello world" a
    t coordinates (100,100).
    img.display("My first CImg code");             // Display the image in a displa
    y window.
    return 0;
}
```

Which can be also written in a more compact way as :

```
#include "CImg.h"
using namespace cimg_library;

int main() {
    const unsigned char purple[] = { 255,0,255 };
    CImg<unsigned char>(640,400,1,3,0).draw_text(100,100,"Hello World",purple).di
    splay("My first CImg code");
    return 0;
}
```

Generally, you can write very small code that performs complex image processing tasks. The CImg Library is very simple to use and provide a lot of interesting algorithms for image manipulation.

### 6.1.3 How to compile ?

The CImg library is a very light and user-friendly library : only standard system libraries are used. It avoid to handle complex dependancies and problems with library compatibility. The only thing you need is a (quite modern) C++ compiler :

- **Microsoft Visual C++ 6.0, Visual Studio.NET and Visual Express Edition** : Use project files and solution files provided in the CImg Library package (directory 'compilation/') to see how it works.
- **Intel ICL compiler** : Use the following command to compile a CImg-based program with ICL :

```
icl /Ox hello_world.cpp user32.lib gdi32.lib
```

- **g++ (MingW windows version)** : Use the following command to compile a CImg-based program with g++, on Windows :

```
g++ -o hello_word.exe hello_word.cpp -O2 -lgdi32
```

- **g++ (Linux version)** : Use the following command to compile a CImg-based program with g++, on Linux :

```
g++ -o hello_word.exe hello_world.cpp -O2 -L/usr/X11R6/lib -lm -lpthread -lX11
```

- **g++ (Solaris version)** : Use the following command to compile a CImg-based program with g++, on Solaris :

```
g++ -o hello_word.exe hello_world.cpp -O2 -lm -lpthread -R/usr/X11R6/lib -lrt -l  
nsl -lsocket
```

- **g++ (Mac OS X version)** : Use the following command to compile a CImg-based program with g++, on Mac OS X :

```
g++ -o hello_word.exe hello_world.cpp -O2 -lm -lpthread -L/usr/X11R6/lib -lm -l  
pthread -lX11
```

- **Dev-Cpp** : Use the project file provided in the CImg library package to see how it works.

If you are using another compilers and encounter problems, please [write me](#) since maintaining compatibility is one of the priority of the CImg Library. Nevertheless, old compilers that does not respect the C++ norm will not support the CImg Library.

### 6.1.4 What's next ?

If you are ready to get more, and to start writing more serious programs with CImg, you are invited to go to the [Tutorial : Getting Started](#). section.

## 6.2 CImg<T> : The image structure.

Description of the CImg<T> structure

### **6.2.1 Structure overview**

### **6.2.2 Image construction/destruction/copy**

### **6.2.3 Image methods**

## 6.6.2 1. General information and availability

### 6.6.2.1 1.1. What is the CImg Library ?

The CImg Library is an *open-source C++ toolkit for image processing*.

It mainly consists in a (big) single header file `CImg.h` providing a set of C++ classes and functions that can be used in your own sources, to load/save, manage/process and display generic images. It's actually a very simple and pleasant toolkit for coding image processing stuffs in C++ : Just include the header file `CImg.h`, and you are ready to handle images in your C++ programs.

### 6.6.2.2 1.2. What platforms are supported ?

CImg has been designed with *portability* in mind. It is regularly tested on different architectures and compilers, and should also work on any decent OS having a decent C++ compiler. Before each release, the CImg Library is compiled under these different configurations :

- PC Linux 32 bits, with g++.
- PC Windows 32 bits, with Visual C++ 6.0.
- PC Windows 32 bits, with Visual C++ Express Edition.
- Sun SPARC Solaris 32 bits, with g++.
- Mac PPC with OS X and g++.

CImg has a minimal number of dependencies. In its minimal version, it can be compiled only with standard C++ headers. Anyway, it has interesting extension capabilities and can use external libraries to perform specific tasks more efficiently (Fourier Transform computation using FFTW for instance).

### 6.6.2.3 1.3. How is CImg distributed ?

The CImg Library is freely distributed as a complete .zip compressed package, hosted at the [Sourceforge servers](#).

The package is distributed under the [CeCILL license](#).

This package contains :

- The main library file `CImg.h` (C++ header file).
- Several C++ source code showing [examples of using CImg](#).
- A complete library documentation, in [HTML](#) and [PDF](#) formats.
- Additional [library plug-ins](#) that can be used to extend library capabilities for specific uses.

The CImg Library is a quite lightweight library which is easy to maintain (due to its particular structure), and thus has a fast rythm of release. A new version of the CImg package is released approximately every three months.

#### 6.6.2.4 1.4. What kind of people are concerned by CImg ?

The CImg library is an *image processing* library, primarily intended for computer scientists or students working in the fields of image processing or computer vision, and knowing bases of C++. As the library is handy and really easy to use, it can be also used by any programmer needing occasional tools for dealing with images in C++, since there are no standard library yet for this purpose.

#### 6.6.2.5 1.5. What are the specificities of the CeCILL license ?

The [CeCILL license](#) governs the use of the CImg Library. This is an *open-source* license which gives you rights to access, use, modify and redistribute the source code, under certains conditions. There are two different variants of the CeCILL license used in CImg (namely [CeCILL](#) and [CeCILL-C](#), all open-source), corresponding to different constraints on the source files :

- The [CeCILL-C](#) license is the most permissive one, close to the *GNU LGPL license*, and *applies only on the main library file `CImg.h`*. Basically, this license allows to use `CImg.h` in a closed-source product without forcing you to redistribute the entire software source code. Anyway, if one modifies the `CImg.h` source file, one has to redistribute the modified version of the file that must be governed by the same [CeCILL-C](#) license.
- The [CeCILL](#) license applies to all other files (source examples, plug-ins and documentation) of the CImg Library package, and is close (even *compatible*) with the *GNU GPL license*. It *does not allow* the use of these files in closed-source products.

You are invited to read the complete descriptions of the the [CeCILL-C](#) and [CeCILL](#) licenses before releasing a software based on the CImg Library.

#### 6.6.2.6 1.6. Who is behind CImg ?

CImg has been started by [David Tschumperle](#) at the beginning of his PhD thesis, in October 1999. He is still the main coordinator of the project. Since the first release at Sourceforge, a growing number of contributors has appeared. Due to the very simple and compact form of the library, submitting a contribution is quite easy and can be fastly integrated into the supported releases. List of contributors can be found on the front page.

### 6.6.3 2. C++ related questions

#### 6.6.3.1 2.1 What is the level of C++ knowledge needed to use CImg ?

The CImg Library has been designed using C++ templates and object-oriented programming techniques, but in a very accessible level. There are only public classes without any derivation (just like C structures)

and there is at most one template parameter for each CImg class (defining the pixel type of the images). The design is simple but clean, making the library accessible even for non professional C++ programmers, while proposing strong extension capabilities for C++ experts.

### 6.6.3.2 2.2 How to use CImg in my own C++ program ?

Basically, you need to add these two lines in your C++ source code, in order to be able to work with CImg images :

```
#include "CImg.h"
using namespace cimg_library;
```

### 6.6.3.3 2.3 Why is CImg entirely contained in a single header file ?

People are often surprised to see that the complete code of the library is contained in a single (big) C++ header file `CImg.h`. There are good practical and technical reasons to do that. Some arguments are listed below to justify this approach, so (I hope) you won't think this is a awkwardly C++ design of the CImg library :

- First, the library is based on *template datatypes* (images with generic pixel type), meaning that the programmer is free to decide what type of image he instantiates in his code. Even if there are roughly a limited number of fully supported types (basically, the "atomic" types of C++ : *unsigned char*, *int*, *float*, ...), this is *not imaginable* to pre-compile the library classes and functions for *all possible atomic datatypes*, since many functions and methods can have two or three arguments having different template parameters. This really means *a huge number* of possible combinations. The size of the object binary file generated to cover all possible cases would be just *colossal*. Is the STL library a pre-compiled one ? No, CImg neither. CImg is not using a classical *.cpp* and *.h* mechanism, just like the STL. Architectures of C++ *template-based* libraries are somewhat special in this sense. This is a proven technical fact.
- Second, why CImg does not have several header files, just like the STL does (one for each class for instance) ? This would be possible of course. There are only 4 classes in CImg, the two most important being *CImg<T>* and *CImgList<T>* representing respectively an image and a collection of images. But contrary to the STL library, these two CImg classes are strongly *inter-dependent*. All CImg algorithms are actually not defined as separate functions acting on containers (as the STL does with his header `<algorithm>`), but are directly methods of the image and image collection classes. This inter-dependence practically means that you will undoubtedly need these two main classes at the same time if you are using CImg. If they were defined in separate header files, you would be forced to include both of them. What is the gain then ? No gain.

Concerning the two other classes : You can disable the third most important class *CImgDisplay* of the CImg library, by setting the compilation macro *cimg\_display* to 0, avoiding thus to compile this class if you don't use display capabilities of CImg in your code. But to be honest, this is a quite small class and doing this doesn't save much compilation time. The last and fourth class is *CImgException*, which is only few lines long and is obviously required in almost all methods of CImg. Including this one is *mandatory*.

As a consequence, having a single header file instead of several ones is just a way for you to avoid including all of them, without any consequences on compilation time. This is both good technical and practical reasons to do like this.

- Third, having a single header file has plenty of advantages : Simplicity for the user, and for the developers (maintenance is in fact easier). Look at the *CImg.h* file, it looks like a mess at a first glance, but it is in fact very well organized and structured. Finding pieces of code in CImg functions

or methods is particularly easy and fast. Also, how about the fact that library installation problems just disappear ? Just bring *CImg.h* with you, put it in your source directory, and the library is ready to go !

I admit the compilation time of CImg-based programs can be sometime long, but don't think that it is due to the fact that you are using a single header file. Using several header files wouldn't arrange anything since you would need all of them. Having a pre-compiled library object would be the only solution to speed up compilation time, but it is not possible at all, due to the too much generic nature of the library. Think seriously about it, and if you have a better solution to provide, let me know so we can discuss about it.

## 6.7 Setting Environment Variables

The CImg library is a multiplatform library, working on a wide variety of systems. This implies the existence of some *environment variables* that must be correctly defined depending on your current system. Most of the time, the CImg Library defines these variables automatically (for popular systems). Anyway, if your system is not recognized, you will have to set the environment variables by hand. Here is a quick explanations of environment variables.

Setting the environment variables is done with the `define` keyword. This setting must be done *before including the file CImg.h* in your source code. For instance, defining the environment variable `cimg_display` would be done like this :

```
#define cimg_display 0
#include "CImg.h"
...
```

Here are the different environment variables used by the CImg Library :

- **cimg\_OS** : This variable defines the type of your Operating System. It can be set to **1** (*Unix*), **2** (*Windows*), or **0** (*Other configuration*). It should be actually auto-detected by the CImg library. If this is not the case (`cimg_OS=0`), you will probably have to tune the environment variables described below.
- **cimg\_display** : This variable defines the type of graphical library used to display images in windows. It can be set to 0 (no display library available), **1** (X11-based display) or **2** (Windows-GDI display). If you are running on a system without X11 or Windows-GDI ability, please set this variable to 0. This will disable the display support, since the CImg Library doesn't contain the necessary code to display images on systems other than X11 or Windows GDI.
- **cimg\_use\_vt100** : This variable tells the library if the system terminal has VT100 color capabilities. It can be *defined* or *not defined*. Define this variable to get colored output on your terminal, when using the CImg Library.
- **cimg\_verbosity** : This variable defines the level of run-time debug messages that will be displayed by the CImg Library. It can be set to 0 (no debug messages), 1 (normal debug messages displayed on standard error), 2 (normal debug messages displayed in modal windows, which is the default value), or 3 (high debug messages). Note that setting this value to 3 may slow down your program since more debug tests are made by the library (particularly to check if pixel access is made outside image boundaries). See also CImgException to better understand how debug messages are working.

- **cimg\_plugin** : This variable tells the library to use a plugin file to add features to the CImg<T> class. Define it with the path of your plugin file, if you want to add member functions to the CImg<T> class, without having to modify directly the "CImg.h" file. An include of the plugin file is performed in the CImg<T> class. If cimg\_plugin is not specified (default), no include is done.
- **cimglist\_plugin** : Same as cimg\_plugin, but to add features to the CImgList<T> class.
- **cimgdisplay\_plugin** : Same as cimg\_plugin, but to add features to the CImgDisplay<T> class.

All these compilation variables can be checked, using the function `cimg_library::cimg::info()`, which displays a list of the different configuration variables and their values on the standard error output.

## 6.8 How to use CImg library with Visual C++ 2005 Express Edition ?.

### 6.8.1 How to use CImg library with Visual C++ 2005 Express Edition ?

This section has been written by Vincent Garcia and Alexandre Fournier from I3S/Sophia\_Antipolis.

- Download CImg library
- Download and install Visual C++ 2005 Express Edition
- Download and install Microsoft Windows SDK
- Configure Visual C++ to take into account Microsoft SDK
  - 1. Go to menu "Tools -> options"
  - 2. Select option "Projects and Solutions -> VC++ Directories"
  - 3. In the select list "Show directories for", choose "include files", and add C: Files Platform SDK (adapt if needed)
  - 4. In the select list "Show directories for", choose "library files", and add C: Files Platform SDK (adapt if needed) Edit file C: Files Visual Studio 8\VC\VCProjectDefaults\corewin\_express.vsprops (adapt if needed)
  - 6. 7. Remplace the line `AdditionalDependencies="kernel32.lib" />` by `AdditionalDependencies="kernel32.lib user32.lib gdi32.lib winspool.lib comdlg32.lib advapi32.lib shell32.lib ole32.lib oleaut32.lib uuid.lib" />`
- Restart Visual C++
- Import CImg library in your main file

## 6.9 Tutorial : Getting Started.

Let's start to write our first program to get the idea. This will demonstrate how to load and create images, as well as handle image display and mouse events. Assume we want to load a color image `lena.jpg`, smooth it, display it in a windows, and enter an event loop so that clicking a point in the image will draw the (R,G,B) intensity profiles of the corresponding image line (in another window). Yes, that sounds quite complex for a first code, but don't worry, it will be very simple using the CImg library ! Well, just look at the code below, it does the task :

```

#include "CImg.h"
using namespace cimg_library;

int main() {
    CImg<unsigned char> image("lena.jpg"), visu(500,400,1,3,0);
    const unsigned char red[] = { 255,0,0 }, green[] = { 0,255,0 }, blue[] = { 0,
        0,255 };
    image.blur(2.5);
    CImgDisplay main_disp(image,"Click a point"), draw_disp(visu,"Intensity profile");
    while (!main_disp.is_closed() && !draw_disp.is_closed()) {
        main_disp.wait();
        if (main_disp.button() && main_disp.mouse_y()>=0) {
            const int y = main_disp.mouse_y();
            visu.fill(0).draw_graph(image.get_crop(0,y,0,0,image.width()-1,y,0,0),red
                ,1,1,0,255,0);
            visu.draw_graph(image.get_crop(0,y,0,1,image.width()-1,y,0,1),green,1,1,0
                ,255,0);
            visu.draw_graph(image.get_crop(0,y,0,2,image.width()-1,y,0,2),blue,1,1,0,
                255,0).display(draw_disp);
        }
    }
    return 0;
}

```

Here is a screenshot of the resulting program :

And here is the detailed explanation of the source, line by line :

```
#include "CImg.h"
```

Include the main and only header file of the CImg library.

```
using namespace cimg_library;
```

Use the library namespace to ease the declarations afterward.

```
int main() {
```

Definition of the main function.

```
CImg<unsigned char> image("lena.jpg"), visu(500,400,1,3,0);
```

Creation of two instances of images of unsigned char pixels. The first image `image` is initialized by reading an image file from the disk. Here, `lena.jpg` must be in the same directory than the current program. Note that you must also have installed the *ImageMagick* package in order to be able to read JPG images. The second image `visu` is initialized as a black color image with dimension `dx=500`, `dy=400`, `dz=1` (here, it is a 2D image, not a 3D one), and `dv=3` (each pixel has 3 'vector' channels R,G,B). The last argument in the constructor defines the default value of the pixel values (here 0, which means that `visu` will be initially black).

```
const unsigned char red[] = { 255,0,0 }, green[] = { 0,255,0 }, blue[] = { 0,0,255 };
```

Definition of three different colors as array of unsigned char. This will be used to draw plots with different colors.

```
image.blur(2.5);
```

Blur the image, with a gaussian blur and a standard variation of 2.5. Note that most of the CImg functions have two versions : one that acts in-place (which is the case of `blur`), and one that returns the result as a new image (the name of the function begins then with `get_`). In this case, one could have also written `image = image.get_blur(2.5);` (more expensive, since it needs an additional copy operation).

```
CImgDisplay main_disp(image, "Click a point"), draw_disp(visu, "Intensity profile"
);
```

Creation of two display windows, one for the input image `image`, and one for the image `visu` which will be display intensity profiles. By default, CImg displays handles events (mouse, keyboard,...). On Windows, there is a way to create fullscreen displays.

```
while (!main_disp.is_closed() && !draw_disp.is_closed()) {
```

Enter the event loop, the code will exit when one of the two display windows is closed.

```
main_disp.wait();
```

Wait for an event (mouse, keyboard,...) in the display window `main_disp`.

```
if (main_disp.button() && main_disp.mouse_y() >= 0) {
```

Test if the mouse button has been clicked on the image area. One may distinguish between the 3 different mouse buttons, but in this case it is not necessary

```
const int y = main_disp.mouse_y();
```

Get the image line y-coordinate that has been clicked.

```
visu.fill(0).draw_graph(image.get_crop(0,y,0,0,image.width()-1,y,0,0),red,1,0,25
6,0);
```

This line illustrates the pipeline property of most of the CImg class functions. The first function `fill(0)` simply sets all pixel values with 0 (i.e. clear the image `visu`). The interesting thing is that it returns a reference to `visu` and then, can be pipelined with the function `draw_graph()` which draws a plot in the image `visu`. The plot data are given by another image (the first argument of `draw_graph()`). In this case, the given image is the red-component of the line `y` of the original image, retrieved by the function `get_crop()` which returns a sub-image of the image `image`. Remember that images coordinates are 4D (`x,y,z,v`) and for color images, the R,G,B channels are respectively given by `v=0`, `v=1` and `v=2`.

```
visu.draw_graph(image.get_crop(0,y,0,1,image.width()-1,y,0,1),green,1,0,256,0);
```

Plot the intensity profile for the green channel of the clicked line.

```
visu.draw_graph(image.get_crop(0,y,0,2,image.width()-1,y,0,2),blue,1,0,256,0).di
splay(draw_disp);
```

Same thing for the blue channel. Note how the function (which return a reference to `visu`) is pipelined with the function `display()` that just paints the image `visu` in the corresponding display window.

```
...till the end
```

I don't think you need more explanations !

As you have noticed, the CImg library allows to write very small and intuitive code. Note also that this source will perfectly work on Unix and Windows systems. Take also a look to the examples provided in the CImg package ( directory `examples/` ). It will show you how CImg-based code can be surprisingly small. Moreover, there is surely one example close to what you want to do. A good start will be to look at the file `CImg_demo.cpp` which contains small and various examples of what you can do with the CImg Library. All CImg classes are used in this source, and the code can be easily modified to see what happens.

## 6.10 Using Drawing Functions.

### 6.10.1 Using Drawing Functions.

This section tells more about drawing features in CImg images. Drawing functions list can be found in [the CImg functions list](#) (section **Drawing Functions**), and are all defined on a common basis. Here are the important points to understand before using drawing functions :

- Drawing is performed on the instance image. Drawing functions parameters are defined as *const* variables and return a reference to the current instance (*\*this*), so that drawing functions can be pipelined (see examples below). Drawing is usually done in 2D color images but can be performed in 3D images with any vector-valued dimension, and with any possible pixel type.
- A color parameter is always needed to draw features in an image. The color must be defined as a C-style array whose dimension is at least

## 6.11 Using Image Loops.

The CImg Library provides different macros that define useful iterative loops over an image. Basically, it can be used to replace one or several `for ( . . )` instructions, but it also proposes interesting extensions to classical loops. Below is a list of all existing loop macros, classified in four different categories :

- [Loops over the pixel buffer](#)
- [Loops over image dimensions](#)
- [Loops over interior regions and borders.](#)
- [Loops using neighborhoods.](#)

### 6.11.1 Loops over the pixel buffer

Loops over the pixel buffer are really basic loops that iterate a pointer on the pixel data buffer of a `cimg_library::CImg` image. Two macros are defined for this purpose :

- **cimg\_for(img,ptr,T)** : This macro loops over the pixel data buffer of the image `img`, using a pointer `T* ptr`, starting from the end of the buffer (last pixel) till the beginning of the buffer (first pixel).
  - `img` must be a (non empty) `cimg_library::CImg` image of pixels `T`.
  - `ptr` is a pointer of type `T*`. This kind of loop should not appear a lot in your own source code, since this is a low-level loop and many functions of the CImg class may be used instead. Here is an example of use :
 

```
CImg<float> img(320,200);
cimg_for(img,ptr,float) { *ptr=0; }           // Equivalent to 'img.fill(0);'
```
- **cimg\_foroff(img,off)** : This macro loops over the pixel data buffer of the image `img`, using an offset `,` starting from the beginning of the buffer (first pixel, `off=0`) till the end of the buffer (last pixel value, `off = img.size()-1`).
  - `img` must be a (non empty) `cimg_library::CImg<T>` image of pixels `T`.
  - `off` is an inner-loop variable, only defined inside the scope of the loop.

Here is an example of use :

```
CImg<float> img(320,200);
cimg_foroff(img,off) { img[off]=0; } // Equivalent to 'img.fill(0);'
```

### 6.11.2 Loops over image dimensions

The following loops are probably the most used loops in image processing programs. They allow to loop over the image along one or several dimensions, along a raster scan course. Here is the list of such loop macros for a single dimension :

- **cimg\_forX(img,x)** : equivalent to : `for (int x = 0; x<img.width(); x++).`
- **cimg\_forY(img,y)** : equivalent to : `for (int y = 0; y<img.height(); y++).`
- **cimg\_forZ(img,z)** : equivalent to : `for (int z = 0; z<img.depth(); z++).`
- **cimg\_forC(img,v)** : equivalent to : `for (int v = 0; v<img.spectrum(); v++).`

Combinations of these macros are also defined as other loop macros, allowing to loop directly over 2D, 3D or 4D images :

- **cimg\_forXY(img,x,y)** : equivalent to : `cimg_forY(img,y) cimg_forX(img,x).`
- **cimg\_forXZ(img,x,z)** : equivalent to : `cimg_forZ(img,z) cimg_forX(img,x).`
- **cimg\_forYZ(img,y,z)** : equivalent to : `cimg_forZ(img,z) cimg_forY(img,y).`
- **cimg\_forXC(img,x,v)** : equivalent to : `cimg_forC(img,v) cimg_forX(img,x).`
- **cimg\_forYC(img,y,v)** : equivalent to : `cimg_forC(img,v) cimg_forY(img,y).`
- **cimg\_forZC(img,z,v)** : equivalent to : `cimg_forC(img,v) cimg_forZ(img,z).`
- **cimg\_forXYZ(img,x,y,z)** : equivalent to : `cimg_forZ(img,z) cimg_forXY(img,x,y).`
- **cimg\_forXYC(img,x,y,v)** : equivalent to : `cimg_forC(img,v) cimg_forXY(img,x,y).`
- **cimg\_forXZC(img,x,z,v)** : equivalent to : `cimg_forC(img,v) cimg_forXZ(img,x,z).`
- **cimg\_forYZC(img,y,z,v)** : equivalent to : `cimg_forC(img,v) cimg_forYZ(img,y,z).`
- **cimg\_forXYZC(img,x,y,z,v)** : equivalent to : `cimg_forC(img,v) cimg_forXYZ(img,x,y,z).`
- For all these loops, `x,y,z` and `v` are inner-defined variables only visible inside the scope of the loop. They don't have to be defined before the call of the macro.
- `img` must be a (non empty) [cimg\\_library::CImg](#) image.

Here is an example of use that creates an image with a smooth color gradient :

```
CImg<unsigned char> img(256,256,1,3); // Define a 256x256 color image
cimg_forXYC(img,x,y,v) { img(x,y,v) = (x+y)*(v+1)/6; }
img.display("Color gradient");
```

### 6.11.3 Loops over interior regions and borders.

Similar macros are also defined to loop only on the border of an image, or inside the image (excluding the border). The border may be several pixel wide :

- **cimg\_for\_insideX(img,x,n)** : Loop along the x-axis, except for pixels inside a border of n pixels wide.
- **cimg\_for\_insideY(img,y,n)** : Loop along the y-axis, except for pixels inside a border of n pixels wide.
- **cimg\_for\_insideZ(img,z,n)** : Loop along the z-axis, except for pixels inside a border of n pixels wide.
- **cimg\_for\_insideC(img,v,n)** : Loop along the v-axis, except for pixels inside a border of n pixels wide.
- **cimg\_for\_insideXY(img,x,y,n)** : Loop along the (x,y)-axes, excepted for pixels inside a border of n pixels wide.
- **cimg\_for\_insideXYZ(img,x,y,z,n)** : Loop along the (x,y,z)-axes, excepted for pixels inside a border of n pixels wide.

And also :

- **cimg\_for\_borderX(img,x,n)** : Loop along the x-axis, only for pixels inside a border of n pixels wide.
- **cimg\_for\_borderY(img,y,n)** : Loop along the y-axis, only for pixels inside a border of n pixels wide.
- **cimg\_for\_borderZ(img,z,n)** : Loop along the z-axis, only for pixels inside a border of n pixels wide.
- **cimg\_for\_borderC(img,v,n)** : Loop along the z-axis, only for pixels inside a border of n pixels wide.
- **cimg\_for\_borderXY(img,x,y,n)** : Loop along the (x,y)-axes, only for pixels inside a border of n pixels wide.
- **cimg\_for\_borderXYZ(img,x,y,z,n)** : Loop along the (x,y,z)-axes, only for pixels inside a border of n pixels wide.
- For all these loops, x,y,z and v are inner-defined variables only visible inside the scope of the loop. They don't have to be defined before the call of the macro.
- img must be a (non empty) [cimg\\_library::CImg](#) image.
- The constant n stands for the size of the border.

Here is an example of use, to create a 2d grayscale image with two different intensity gradients :

```
CImg<> img(256,256);
cimg_for_insideXY(img,x,y,50) img(x,y) = x+y;
cimg_for_borderXY(img,x,y,50) img(x,y) = x-y;
img.display();
```

### 6.11.4 Loops using neighborhoods.

Inside an image loop, it is often useful to get values of neighborhood pixels of the current pixel at the loop location. The CImg Library provides a very smart and fast mechanism for this purpose, with the definition of several loop macros that remember the neighborhood values of the pixels. The use of these macros can highly optimize your code, and also simplify your program.

#### 6.11.4.1 Neighborhood-based loops for 2D images

For 2D images, the neighborhood-based loop macros are :

- **cimg\_for2x2(img,x,y,z,v,I)** : Loop along the (x,y)-axes using a centered 2x2 neighborhood.
- **cimg\_for3x3(img,x,y,z,v,I)** : Loop along the (x,y)-axes using a centered 3x3 neighborhood.
- **cimg\_for4x4(img,x,y,z,v,I)** : Loop along the (x,y)-axes using a centered 4x4 neighborhood.
- **cimg\_for5x5(img,x,y,z,v,I)** : Loop along the (x,y)-axes using a centered 5x5 neighborhood.

For all these loops, *x* and *y* are inner-defined variables only visible inside the scope of the loop. They don't have to be defined before the call of the macro. *img* is a non empty CImg<T> image. *z* and *v* are constants that define on which image slice and vector channel the loop must apply (usually both 0 for grayscale 2D images). Finally, *I* is the 2x2, 3x3, 4x4 or 5x5 neighborhood that will be updated with the correct pixel values during the loop (see [Defining neighborhoods](#)).

#### 6.11.4.2 Neighborhood-based loops for 3D images

For 3D images, the neighborhood-based loop macros are :

- **cimg\_for2x2x2(img,x,y,z,v,I)** : Loop along the (x,y,z)-axes using a centered 2x2x2 neighborhood.
- **cimg\_for3x3x3(img,x,y,z,v,I)** : Loop along the (x,y,z)-axes using a centered 3x3x3 neighborhood.

For all these loops, *x*, *y* and *z* are inner-defined variables only visible inside the scope of the loop. They don't have to be defined before the call of the macro. *img* is a non empty CImg<T> image. *v* is a constant that defines on which image channel the loop must apply (usually 0 for grayscale 3D images). Finally, *I* is the 2x2x2 or 3x3x3 neighborhood that will be updated with the correct pixel values during the loop (see [Defining neighborhoods](#)).

#### 6.11.4.3 Defining neighborhoods

A neighborhood is defined as an instance of a class having operator[] defined. This particularly includes classical C-array, as well as CImg<T> objects.

For instance, a 3x3 neighborhood can be defined either as a 'float[9]' or a 'CImg<float>(3,3)' variable.

#### 6.11.4.4 Using alternate variable names

There are also some useful macros that can be used to define variables that reference the neighborhood elements. There are :

- **CImg\_2x2(I,type)** : Define a 2x2 neighborhood named *I*, of type *type*.

- **CImg\_3x3(I,type)** : Define a 3x3 neighborhood named I, of type type.
- **CImg\_4x4(I,type)** : Define a 4x4 neighborhood named I, of type type.
- **CImg\_5x5(I,type)** : Define a 5x5 neighborhood named I, of type type.
- **CImg\_2x2x2(I,type)** : Define a 2x2x2 neighborhood named I, of type type.
- **CImg\_3x3x3(I,type)** : Define a 3x3x3 neighborhood named I, of type type.

Actually, I is a *generic name* for the neighborhood. In fact, these macros declare a *set* of new variables. For instance, defining a 3x3 neighborhood `CImg_3x3(I, float)` declares 9 different float variables `Ipp, Icp, Inp, Ipc, Icc, Inc, Ipn, Icn, Inn` which correspond to each pixel value of a 3x3 neighborhood. Variable indices are p, c or n, and stand respectively for '*previous*', '*current*' and '*next*'. First indice denotes the x-axis, second indice denotes the y-axis. Then, the names of the variables are directly related to the position of the corresponding pixels in the neighborhood. For 3D neighborhoods, a third indice denotes the z-axis. Then, inside a neighborhood loop, you will have the following equivalence :

- `Ipp = img(x-1, y-1)`
- `Icn = img(x, y+1)`
- `Inp = img(x+1, y-1)`
- `Inpc = img(x+1, y-1, z)`
- `Ippn = img(x-1, y-1, z+1)`
- and so on...

For bigger neighborhoods, such as 4x4 or 5x5 neighborhoods, two additionnal indices are introduced : a (stands for '*after*') and b (stands for '*before*'), so that :

- `Ibb = img(x-2, y-2)`
- `Ina = img(x+1, y+2)`
- and so on...

The value of a neighborhood pixel outside the image range (image border problem) is automatically set to the same values than the nearest valid pixel in the image (this is also called the *Neumann border condition*).

#### 6.11.4.5 Example codes

More than a long discussion, the above example will demonstrate how to compute the gradient norm of a 3D volume using the `cimg_for3x3x3()` loop macro :

```
CImg<float> volume("IRM.hdr");           // Load an IRM volume from an Analyze7.
5 file
CImg_3x3x3(I, float);                   // Define a 3x3x3 neighborhood
CImg<float> gradnorm(volume);           // Create an image with same size as 'v
  olume'
cimg_for3x3x3(volume, x, y, z, 0, I, float) { // Loop over the volume, using the neig
  hborhood I
  const float ix = 0.5f*(Incc-Ipcc);      // Compute the derivative along the x-a
  xis.
  const float iy = 0.5f*(Icnc-Icpc);      // Compute the derivative along the y-a
  xis.
```

```

const float iz = 0.5f*(Iccn-Iccp);    // Compute the derivative along the z-axis.
gradnorm(x,y,z) = std::sqrt(ix*ix+iy*iy+iz*iz); // Set the gradient norm in the destination image
}
gradnorm.display("Gradient norm");

```

And the following example shows how to deal with neighborhood references to blur a color image by averaging pixel values on a 5x5 neighborhood.

```

CImg<unsigned char> src("image_color.jpg"), dest(src,false), neighbor(5,5); //
    Image definitions.
typedef unsigned char uchar; // Avoid space in the second parameter
    of the macro CImg_5x5x1 below.
CImg<> N(5,5); // Define a 5x5 neighborhood as a 5x5
    image.
cimg_forC(src,k) // Standard loop on color channels
    cimg_for5x5(src,x,y,0,k,N,float) // 5x5 neighborhood loop.
        dest(x,y,k) = N.sum() / (5*5); // Averaging pixels to filter the color image.
CImgList<unsigned char> visu(src,dest);
visu.display("Original + Filtered"); // Display both original and filtered
    image.

```

As you can see, explaining the use of the CImg neighborhood macros is actually more difficult than using them !

## 6.12 Using Display Windows.

When opening a display window, you can choose the way the pixel values will be normalized before being displayed on the screen. Screen displays only support color values between [0,255], and some

When displaying an image into the display window using CImgDisplay::display(), values of the image pixels can be eventually linearly normalized between [0,255] for visualization purposes. This may be useful for instance when displaying CImg<double> images with pixel values between [0,1]. The normalization behavior depends on the value of `normalize` which can be either 0, 1 or 2 :

- 0 : No pixel normalization is performed when displaying an image. This is the fastest process, but you must be sure your displayed image have pixel values inside the range [0,255].
- 1 : Pixel value normalization is done for each new image display. Image pixels are not modified themselves, only displayed pixels are normalized.
- 2 : Pixel value normalization is done for the first image display, then the normalization parameters are kept and used for all the next image displays.

## 6.13 How pixel data are stored with CImg.

First, CImg<T> are *very* basic structures, which means that there are no memory tricks, weird memory alignments or disk caches used to store pixel data of images. When an image is instanced, all its pixel values are stored in memory at the same time (yes, you should avoid working with huge images when dealing with CImg, if you have only 64kb of RAM).

A CImg<T> is basically a 4th-dimensional array (width,height,depth,dim), and its pixel data are stored linearly in a single memory buffer of general size (width\*height\*depth\*dim). Nothing more, nothing

less. The address of this memory buffer can be retrieved by the function `CImg<T>::data()`. As each image value is stored as a type `T` (`T` being known by the programmer of course), this pointer is a `'T*'`, or a `'const T*'` if your image is `'const'`. so, `'T *ptr = img.data()'` gives you the pointer to the first value of the image `'img'`. The overall size of the used memory for one instance image (in bytes) is then `'width*height*depth*dim*sizeof(T)'`.

Now, the ordering of the pixel values in this buffer follows these rules : The values are *\*not\** interleaved, and are ordered first along the X,Y,Z and V axis respectively (corresponding to the width,height,depth,dim dimensions), starting from the upper-left pixel to the bottom-right pixel of the instane image, with a classical scanline run.

So, a color image with `dim=3` and `depth=1`, will be stored in memory as :

`R1R2R3R4R5R6.....G1G2G3G4G5G6.....B1B2B3B4B5B6....` (i.e following a 'planar' structure)

and *\*not\** as `R1G1B1R2G2B2R3G3B3...` (interleaved channels), where `R1 = img(0,0,0,0)` is the first upper-left pixel of the red component of the image, `R2 = img(1,0,0,0)`, `G1 = img(0,0,0,1)`, `G2 = img(1,0,0,1)`, `B1 = img(0,0,0,2)`, and so on...

Another example, a `(1x5x1x1) CImg<T>` (column vector `A`) will be stored as : `A1A2A3A4A5` where `A1 = img(0,0)`, `A2 = img(0,1)`, ... , `A5 = img(0,4)`.

As you see, it is *\*very\** simple and intuitive : no interleaving, no padding, just simple. This is cool not only because it is simple, but this has in fact a number of interesting properties. For instance, a 2D color image is stored in memory exactly as a 3D scalar image having a `depth=3`, meaning that when you are dealing with 2D color images, you can write `'img(x,y,k)'` instead of `'img(x,y,0,k)'` to access the `k`th channel of the `(x,y)` pixel. More generally, if you have one dimension that is 1 in your image, you can just skip it in the call to the operator(). Similarly, values of a column vector stored as an image with `width=depth=spectrum=1` can be accessed by `'img(y)'` instead of `'img(0,y)'`. This is very convenient.

Another cool thing is that it allows you to work easily with 'shared' images. A shared image is a `CImg<T>` instance that shares its memory with another one (the 'base' image). Destroying a shared image does nothing in fact. Shared images is a convenient way of modifying only *\*portions\** (consecutive in memory) of an image. For instance, if `'img'` is a 2D color image, you can write :

```
img.get_shared_channel(0).blur(2); img.get_shared_channels(1,2).mirror('x');
```

which just blur the red channel of the image, and mirror the two others along the X-axis. This is possible since channels of an image are not interleaved but are stored as different consecutive planes in memory, so you see that constructing a shared image is possible (and trivial).

## 6.14 Files IO in CImg.

The CImg Library can **NATIVELY** handle the following file formats :

- RAW : consists in a very simple header (in ascii), then the image data.
- ASC (Ascii)
- HDR (Analyze 7.5)
- INR (Inrimage)
- PPM/PGM (Portable Pixmap)
- BMP (uncompressed)
- PAN (Pandore-5)

- DLM (Matlab ASCII)

If ImageMagick is installed, The CImg Library can save image in formats handled by ImageMagick : JPG, GIF, PNG, TIF,...

## 6.15 Retrieving Command Line Arguments.

The CImg library offers facilities to retrieve command line arguments in a console-based program, as it is a commonly needed operation. Three macros `cimg_usage()`, `cimg_help()` and `cimg_option()` are defined for this purpose. Using these macros allows to easily retrieve options values from the command line. Invoking the compiled executable with the option `-h` or `--help` will automatically display the program usage, followed by the list of requested options.

### 6.15.1 The `cimg_usage()` macro

The macro `cimg_usage(usage)` may be used to describe the program goal and usage. It is generally inserted one time after the `int main(int argc, char **argv)` definition.

#### Parameters

*usage* : A string describing the program goal and usage.

#### Precondition

The function where `cimg_usage()` is used must have correctly defined `argc` and `argv` variables.

### 6.15.2 The `cimg_help()` macro

The macro `cimg_help(str)` will display the string `str` only if the `-help` or `--help` option are invoked when running the program.

### 6.15.3 The `cimg_option()` macro

The macro `cimg_option(name, default, usage)` may be used to retrieve an option value from the command line.

#### Parameters

*name* : The name of the option to be retrieved from the command line.

*default* : The default value returned by the macro if no options `name` has been specified when running the program.

*usage* : A brief explanation of the option. If `usage==0`, the option won't appear on the option list when invoking the executable with options `-h` or `--help` (hidden option).

#### Returns

`cimg_option()` returns an object that has the *same type* than the default value `default`. The return value is equal to the one specified on the command line. If no such option have been specified, the return value is equal to the default value `default`. Warning, this can be confusing in some situations (look at the end of the next section).

## Precondition

The function where `cimg_option()` is used must have correctly defined `argc` and `argv` variables.

### 6.15.4 Example of use

The code below uses the macros `cimg_usage()` and `cimg_option()`. It loads an image, smoothes it and quantifies it with a specified number of values.

```
#include "CImg.h"
using namespace cimg_library;
int main(int argc, char **argv) {
    cimg_usage("Retrieve command line arguments");
    const char* filename = cimg_option("-i", "image.gif", "Input image file");
    const char* output = cimg_option("-o", (char*)0, "Output image file");
    const double sigma = cimg_option("-s", 1.0, "Standard variation of the gaussian smoothing");
    const int nlevels = cimg_option("-n", 16, "Number of quantification levels");
    const bool hidden = cimg_option("-hidden", false, 0); // This is a hidden option

    CImg<unsigned char> img(filename);
    img.blur(sigma).quantize(nlevels);
    if (output) img.save(output); else img.display("Output image");
    if (hidden) std::fprintf(stderr, "You found me !\n");
    return 0;
}
```

Invoking the corresponding executable with `test -h -hidden -n 20 -i foo.jpg` will display :

```
./test -h -hidden -n 20 -i foo.jpg

test : Retrieve command line arguments (Oct 16 2004, 12:34:26)

-i      = foo.jpg      : Input image file
-o      = 0            : Output image file
-s      = 1           : Standard variation of the gaussian smoothing
-n      = 20          : Number of quantification levels

You found me !
```

## Warning

As the type of object returned by the macro `cimg_option(option, default, usage)` is defined by the type of `default`, undesired casts may appear when writing code such as :

```
const double sigma = cimg_option("-val", 0, "A floating point value");
```

In this case, `sigma` will always be equal to an integer (since the default value 0 is an integer). When passing a float value on the command line, a *float to integer* cast is then done, truncating the given parameter to an integer value (this is surely not a desired behavior). You must specify 0.0 as the default value in this case.

### 6.15.5 How to learn more about command line options ?

You should take a look at the examples `examples/gmic.cpp` provided in the CImg Library package. This is a command line based image converter which intensively uses the `cimg_option()` and `cimg_usage()` macros to retrieve command line parameters.

## Chapter 7

# Namespace Documentation

### 7.1 cimg\_library Namespace Reference

This namespace encompasses all classes and functions of the CImg library.

#### Namespaces

- namespace [cimg](#)

*Namespace that encompasses low-level functions and variables of the CImg Library.*

#### Classes

- struct [CImgException](#)

*Instances of this class are thrown when errors occur during a CImg library function call.*

- struct [CImgDisplay](#)

*This class represents a window which can display [CImg](#) images and handles mouse and keyboard events.*

- struct [CImg](#)

*Class representing an image (up to 4 dimensions wide), each pixel being of type *T*.*

- struct [CImgList](#)

*Class representing list of images *CImg<T>*.*

#### 7.1.1 Detailed Description

This namespace encompasses all classes and functions of the CImg library. This namespace is defined to avoid functions and class names collisions that could happen with the include of other C++ header files. Anyway, it should not happen often and you should reasonably start most of your CImg-based programs with

```
#include "CImg.h"
using namespace cimg_library;
```

to simplify the declaration of CImg Library variables afterwards.

## 7.2 cimg\_library::cimg Namespace Reference

Namespace that encompasses *low-level* functions and variables of the CImg Library.

### Functions

- `std::FILE * output (std::FILE *file)`  
*Set/get output stream for [CImg](#) library messages.*
- `void info ()`  
*Print informations about CImg environnement variables.*
- `double eval (const char *const expression, const double x=0, const double y=0, const double z=0, const double v=0)`  
*Evaluate math expression.*
- `void warn (const char *const format,...)`  
*Display a warning message.*
- `int system (const char *const command, const char *const module_name=0)`
- `template<typename T >  
T & temporary (const T &)`  
*Return a reference to a temporary variable of type T.*
- `template<typename T >  
void swap (T &a, T &b)`  
*Exchange values of variables *a* and *b*.*
- `template<typename T1 , typename T2 >  
void swap (T1 &a1, T1 &b1, T2 &a2, T2 &b2)`  
*Exchange values of variables (*a1,a2*) and (*b1,b2*).*
- `template<typename T1 , typename T2 , typename T3 >  
void swap (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3)`  
*Exchange values of variables (*a1,a2,a3*) and (*b1,b2,b3*).*
- `template<typename T1 , typename T2 , typename T3 , typename T4 >  
void swap (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3, T4 &a4, T4 &b4)`  
*Exchange values of variables (*a1,a2,...,a4*) and (*b1,b2,...,b4*).*
- `template<typename T1 , typename T2 , typename T3 , typename T4 , typename T5 >  
void swap (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3, T4 &a4, T4 &b4, T5 &a5, T5 &b5)`  
*Exchange values of variables (*a1,a2,...,a5*) and (*b1,b2,...,b5*).*
- `template<typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 >  
void swap (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3, T4 &a4, T4 &b4, T5 &a5, T5 &b5, T6 &a6, T6 &b6)`  
*Exchange values of variables (*a1,a2,...,a6*) and (*b1,b2,...,b6*).*

- template<typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 , typename T7 >  
void [swap](#) (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3, T4 &a4, T4 &b4, T5 &a5, T5 &b5, T6 &a6, T6 &b6, T7 &a7, T7 &b7)  
*Exchange values of variables (a1,a2,...,a7) and (b1,b2,...,b7).*
- template<typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 , typename T7 , typename T8 >  
void [swap](#) (T1 &a1, T1 &b1, T2 &a2, T2 &b2, T3 &a3, T3 &b3, T4 &a4, T4 &b4, T5 &a5, T5 &b5, T6 &a6, T6 &b6, T7 &a7, T7 &b7, T8 &a8, T8 &b8)  
*Exchange values of variables (a1,a2,...,a8) and (b1,b2,...,b8).*
- bool [endianness](#) ()  
*Return the current endianness of the CPU.*
- template<typename T >  
void [invert\\_endianness](#) (T \*const buffer, const unsigned int size)  
*Invert endianness of a memory buffer.*
- template<typename T >  
T & [invert\\_endianness](#) (T &a)  
*Invert endianness of a single variable.*
- unsigned long [time](#) ()  
*Get the value of a system timer with a millisecond precision.*
- void [sleep](#) (const unsigned int milliseconds)  
*Sleep for a certain numbers of milliseconds.*
- unsigned int [wait](#) (const unsigned int milliseconds)  
*Wait for a certain number of milliseconds since the last call.*
- template<typename T >  
T [rol](#) (const T a, const unsigned int n=1)  
*Return a left bitwise-rotated number.*
- template<typename T >  
T [ror](#) (const T a, const unsigned int n=1)  
*Return a right bitwise-rotated number.*
- template<typename T >  
T [abs](#) (const T a)  
*Return the absolute value of a number.*
- template<typename T >  
T [sqr](#) (const T val)  
*Return the square of a number.*
- int [xln](#) (const int x)  
*Return  $1 + \log_{10}(x)$ .*

- `template<typename t1 , typename t2 >`  
`cimg::superset< t1, t2 >::type min` (const t1 &a, const t2 &b)  
*Return the minimum value between two numbers.*
- `template<typename t1 , typename t2 , typename t3 >`  
`cimg::superset2< t1, t2, t3 >::type min` (const t1 &a, const t2 &b, const t3 &c)  
*Return the minimum value between three numbers.*
- `template<typename t1 , typename t2 , typename t3 , typename t4 >`  
`cimg::superset3< t1, t2, t3, t4 >::type min` (const t1 &a, const t2 &b, const t3 &c, const t4 &d)  
*Return the minimum value between four numbers.*
- `template<typename t1 , typename t2 >`  
`cimg::superset< t1, t2 >::type max` (const t1 &a, const t2 &b)  
*Return the maximum value between two numbers.*
- `template<typename t1 , typename t2 , typename t3 >`  
`cimg::superset2< t1, t2, t3 >::type max` (const t1 &a, const t2 &b, const t3 &c)  
*Return the maximum value between three numbers.*
- `template<typename t1 , typename t2 , typename t3 , typename t4 >`  
`cimg::superset3< t1, t2, t3, t4 >::type max` (const t1 &a, const t2 &b, const t3 &c, const t4 &d)  
*Return the maximum value between four numbers.*
- `template<typename T >`  
`T sign` (const T x)  
*Return the sign of a number.*
- `template<typename T >`  
`unsigned int nearest_pow2` (const T x)  
*Return the nearest power of 2 higher than a given number.*
- `double sinc` (const double x)  
*Return the `sinc()` of a given number.*
- `template<typename T >`  
`T mod` (const T &x, const T &m)  
*Return the modulo of a number.*
- `template<typename T >`  
`T minmod` (const T a, const T b)  
*Return the minmod of two numbers.*
- `double rand` ()  
*Return a random variable between [0,1] with respect to an uniform distribution.*
- `double crand` ()  
*Return a random variable between [-1,1] with respect to an uniform distribution.*
- `double grand` ()  
*Return a random variable following a gaussian distribution and a standard deviation of 1.*

- unsigned int [prand](#) (const double z)  
*Return a random variable following a Poisson distribution of parameter z.*
- template<typename T >  
T [round](#) (const T x, const double y=1, const int rounding\_type=0)  
*Return a rounded number.*
- char [uncase](#) (const char x)  
*Remove the 'case' of an ASCII character.*
- void [uncase](#) (char \*const string)  
*Remove the 'case' of a C string.*
- double [atof](#) (const char \*const str)  
*Read a double number from a C-string.*
- int [strncasecmp](#) (const char \*const s1, const char \*const s2, const int l)  
*Compare the first n characters of two C-strings, ignoring the case.*
- int [strcasecmp](#) (const char \*const s1, const char \*const s2)  
*Compare two C-strings, ignoring the case.*
- bool [strpare](#) (char \*const s, const char delimiter=' ', const bool symmetric=false, const bool is\_iterative=false)  
*Remove useless delimiters on the borders of a C-string.*
- void [strescape](#) (char \*const s)  
*Replace explicit escape sequences " in C-strings.*
- const char \* [basename](#) (const char \*const s)  
*Compute the basename of a filename.*
- const char \* [temporary\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return or set path to store temporary files.*
- const char \* [imagemagick\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return or set path to the ImageMagick's convert tool.*
- const char \* [graphicsmagick\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return path of the GraphicsMagick's gm tool.*
- const char \* [medcon\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return or set path of the XMedcon tool.*
- const char \* [ffmpeg\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return or set path to the 'ffmpeg' command.*
- const char \* [gzip\\_path](#) (const char \*const user\_path=0, const bool reinit\_path=false)  
*Return or set path to the 'gzip' command.*

- `const char * gunzip\_path (const char *const user_path=0, const bool reinit_path=false)`  
*Return or set path to the 'gunzip' command.*
- `const char * dcraw\_path (const char *const user_path=0, const bool reinit_path=false)`  
*Return or set path to the 'dcraw' command.*
- `const char * split\_filename (const char *const filename, char *const body=0)`  
*Split a filename into two strings 'body' and 'extension'.*
- `char * number\_filename (const char *const filename, const int number, const unsigned int n, char *const string)`  
*Create a numbered version of a filename.*
- `std::FILE * fopen (const char *const path, const char *const mode)`  
*Open a file, and check for possible errors.*
- `int fclose (std::FILE *file)`  
*Close a file, and check for possible errors.*
- `const char * file\_type (std::FILE *const file, const char *const filename)`  
*Try to guess the image format of a filename, using the magic numbers in its header.*
- `template<typename T >`  
`int fread (T *const ptr, const unsigned int nmemb, std::FILE *stream)`  
*Read file data, and check for possible errors.*
- `template<typename T >`  
`int fwrite (const T *ptr, const unsigned int nmemb, std::FILE *stream)`  
*Write data to a file, and check for possible errors.*
- `template<typename t >`  
`int dialog (const char *const title, const char *const msg, const char *const button1_label, const char *const button2_label, const char *const button3_label, const char *const button4_label, const char *const button5_label, const char *const button6_label, const CImg< t > &logo, const bool centering=false)`  
*Display a dialog box, where a user can click standard buttons.*

## Variables

- `const double PI = 3.14159265358979323846`  
*Definition of the mathematical constant PI.*

### 7.2.1 Detailed Description

Namespace that encompasses *low-level* functions and variables of the `CImg` Library. Most of the functions and variables within this namespace are used by the library for low-level processing. Nevertheless, documented variables and functions of this namespace may be used safely in your own source code.

### Warning

Never write using namespace `cimg_library::cimg;` in your source code, since a lot of functions of the `cimg::` namespace have prototypes similar to standard C functions that could be defined in the global namespace `::`.

## 7.2.2 Function Documentation

### 7.2.2.1 void info ( )

Print informations about CImg environnement variables.

Printing is done on the standard error output.

### 7.2.2.2 void cimg\_library::cimg::warn ( const char \*const *format*, ... )

Display a warning message.

### Parameters

*format* is a C-string describing the format of the message, as in `std::printf()`.

### 7.2.2.3 int cimg\_library::cimg::system ( const char \*const *command*, const char \*const *module\_name* = 0 )

### Note

This function is similar to `std::system()` and is here because using the `std::` version on Windows may open undesired consoles.

### 7.2.2.4 bool cimg\_library::cimg::endianness ( )

Return the current endianness of the CPU.

### Returns

`false` for "Little Endian", `true` for "Big Endian".

### 7.2.2.5 void cimg\_library::cimg::sleep ( const unsigned int *milliseconds* )

Sleep for a certain number of milliseconds.

This function frees the CPU resources during the sleeping time. It may be used to temporize your program properly, without wasting CPU time.

### 7.2.2.6 unsigned int cimg\_library::cimg::wait ( const unsigned int *milliseconds* )

Wait for a certain number of milliseconds since the last call.

This function is equivalent to `sleep()` but the waiting time is computed with regard to the last call of `wait()`. It may be used to temporize your program properly.

### 7.2.2.7 `T cimg_library::cimg::abs ( const T a )`

Return the absolute value of a number.

#### Note

This function is different from `std::abs()` or `std::fabs()` because it is able to consider a variable of any type, without cast needed.

### 7.2.2.8 `T cimg_library::cimg::mod ( const T & x, const T & m )`

Return the modulo of a number.

#### Note

This modulo function accepts negative and floating-points modulo numbers, as well as variable of any type.

### 7.2.2.9 `T cimg_library::cimg::minmod ( const T a, const T b )`

Return the minmod of two numbers.

$\text{minmod}(a,b)$  is defined to be :

- $\text{minmod}(a,b) = \min(a,b)$ , if  $a$  and  $b$  have the same sign.
- $\text{minmod}(a,b) = 0$ , if  $a$  and  $b$  have different signs.

### 7.2.2.10 `T cimg_library::cimg::round ( const T x, const double y = 1, const int rounding_type = 0 )`

Return a rounded number.

#### Parameters

$x$  is the number to be rounded.

$y$  is the rounding precision.

*rounding\_type* defines the type of rounding (0=nearest, -1=backward, 1=forward).

#### Returns

the rounded value, with the same type as parameter  $x$ .

### 7.2.2.11 `void cimg_library::cimg::uncase ( char *const string )`

Remove the 'case' of a C string.

Acts in-place.

**7.2.2.12 double cimg\_library::cimg::atof ( const char \*const str )**

Read a double number from a C-string.

**Note**

This function is quite similar to `std::atof()`, but that it allows the retrieval of fractions as in "1/2".

**7.2.2.13 int cimg\_library::cimg::strncasecmp ( const char \*const s1, const char \*const s2, const int l )**

Compare the first `n` characters of two C-strings, ignoring the case.

**Note**

This function is defined since it is not provided by all compilers (not an ANSI function).

**7.2.2.14 int cimg\_library::cimg::strcasecmp ( const char \*const s1, const char \*const s2 )**

Compare two C-strings, ignoring the case.

**Note**

This function is defined since it is not provided by all compilers (not an ANSI function).

**7.2.2.15 int cimg\_library::cimg::dialog ( const char \*const title, const char \*const msg, const char \*const button1\_label, const char \*const button2\_label, const char \*const button3\_label, const char \*const button4\_label, const char \*const button5\_label, const char \*const button6\_label, const CImg< t > & logo, const bool centering = false )**

Display a dialog box, where a user can click standard buttons.

Up to 6 buttons can be defined in the dialog window. This function returns when a user clicked one of the button or closed the dialog window.

**Parameters**

*title* = Title of the dialog window.

*msg* = Main message displayed inside the dialog window.

*button1\_label* = Label of the 1st button.

*button2\_label* = Label of the 2nd button.

*button3\_label* = Label of the 3rd button.

*button4\_label* = Label of the 4th button.

*button5\_label* = Label of the 5th button.

*button6\_label* = Label of the 6th button.

*logo* = Logo image displayed at the left of the main message. This parameter is optional.

*centering* = Tell to center the dialog window on the screen.

**Returns**

The button number (from 0 to 5), or -1 if the dialog window has been closed by the user.

**Note**

If a button text is set to 0, then the corresponding button (and the followings) won't appear in the dialog box. At least one button is necessary.

# Chapter 8

## Class Documentation

### 8.1 CImg< T > Struct Template Reference

Class representing an image (up to 4 dimensions wide), each pixel being of type T.

#### Public Types

- typedef T \* [iterator](#)  
*Iterator type for CImg<T>.*
- typedef const T \* [const\\_iterator](#)  
*Const iterator type for CImg<T>.*
- typedef T [value\\_type](#)  
*Value type.*

#### Constructors / Destructor / Instance Management

- [~CImg](#) ()  
*Destructor.*
- [CImg](#) ()  
*Default constructor.*
- [CImg](#) (const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1)  
*Constructs a new image with given size (dx,dy,dz,dc).*
- [CImg](#) (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const T val)  
*Construct an image with given size (dx,dy,dz,dc) and with pixel having a default value val.*
- [CImg](#) (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const int val0, const int val1,...)

*Construct an image with given size (dx,dy,dz,dc) and with specified pixel values (int version).*

- **CImg** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const double val0, const double val1,...)

*Construct an image with given size (dx,dy,dz,dc) and with specified pixel values (double version).*

- **CImg** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const char \*const values, const bool repeat\_values)

*Construct an image with given size and with specified values given in a string.*

- template<typename t >

**CImg** (const t \*const data\_buffer, const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1, const bool shared=false)

*Construct an image from a raw memory buffer.*

- **CImg** (const T \*const data\_buffer, const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1, const bool shared=false)

- **CImg** (const char \*const filename)

*Construct an image from an image file.*

- template<typename t >

**CImg** (const **CImg**< t > &img)

*Default copy constructor.*

- **CImg** (const **CImg**< T > &img)

- template<typename t >

**CImg** (const **CImg**< t > &img, const bool shared)

*Advanced copy constructor.*

- **CImg** (const **CImg**< T > &img, const bool shared)

- template<typename t >

**CImg** (const **CImg**< t > &img, const char \*const dimensions)

*Construct an image using dimensions of another image.*

- template<typename t >

**CImg** (const **CImg**< t > &img, const char \*const dimensions, const T val)

*Construct an image using dimensions of another image, and fill it with given values.*

- template<typename t >

**CImg** (const **CImg**< t > &img, const char \*const dimensions, const char \*const values, const bool repeat\_values)

*Construct an image using dimensions of another image, and fill it with given values.*

- **CImg** (const **CImgDisplay** &disp)

*Construct an image from the content of a **CImgDisplay** instance.*

- **CImg**< T > & **clear** ()

*In-place version of the default constructor (STL-compliant name).*

- **CImg**< T > & **assign** ()

*In-place version of the default constructor/destructor.*

- **CImg< T > & assign** (const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1)

*In-place version of the previous constructor.*

- **CImg< T > & assign** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const T val)

*In-place version of the previous constructor.*

- **CImg< T > & assign** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const int val0, const int val1,...)

*In-place version of the previous constructor.*

- **CImg< T > & assign** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const double val0, const double val1,...)

*In-place version of the previous constructor.*

- **CImg< T > & assign** (const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const char \*const values, const bool repeat\_values)

*In-place version of the corresponding constructor.*

- template<typename t >  
**CImg< T > & assign** (const t \*const data\_buffer, const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1)

*In-place version of the previous constructor.*

- **CImg< T > & assign** (const T \*const data\_buffer, const unsigned int dx, const unsigned int dy=1, const unsigned int dz=1, const unsigned int dc=1)

- template<typename t >  
**CImg< T > & assign** (const t \*const data\_buffer, const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const bool shared)

*In-place version of the previous constructor, allowing to force the shared state of the instance image.*

- **CImg< T > & assign** (const T \*const data\_buffer, const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const bool shared)

- **CImg< T > & assign** (const char \*const filename)

*In-place version of the previous constructor.*

- template<typename t >  
**CImg< T > & assign** (const CImg< t > &img)

*In-place version of the default copy constructor.*

- template<typename t >  
**CImg< T > & assign** (const CImg< t > &img, const bool shared)

*In-place version of the advanced constructor.*

- template<typename t >  
**CImg< T > & assign** (const CImg< t > &img, const char \*const dimensions)

*In-place version of the previous constructor.*

- `template<typename t >`  
`CImg< T > & assign (const CImg< t > &img, const char *const dimensions, const T val)`  
*In-place version of the previous constructor.*
- `template<typename t >`  
`CImg< T > & assign (const CImg< t > &img, const char *const dimensions, const char *const values, const bool repeat_values)`  
*In-place version of the previous constructor.*
- `CImg< T > & assign (const CImgDisplay &disp)`  
*In-place version of the previous constructor.*
- `template<typename t >`  
`CImg< t > & move_to (CImg< t > &img)`  
*Move the content of the instance image into another one in a way that memory copies are avoided if possible.*
- `CImg< T > & move_to (CImg< T > &img)`
- `template<typename t >`  
`CImgList< t > & move_to (CImgList< t > &list, const unsigned int pos=~0U)`
- `CImg< T > & swap (CImg< T > &img)`  
*Swap all fields of two images. Use with care !*
- `static CImg< T > & empty ()`  
*Return a reference to an empty image.*

## Overloaded Operators

- `T & operator()` (const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0)  
*Fast access to pixel value for reading or writing.*
- `const T & operator()` (const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0) const
- `operator const T * ()` const  
*Return address of the pixel buffer.*
- `operator T * ()`
- `CImg< T > & operator= (const T val)`  
*Operator=().*
- `CImg< T > & operator= (const char *const expression)`  
*Operator=().*
- `template<typename t >`  
`CImg< T > & operator= (const CImg< t > &img)`  
*Operator=().*
- `CImg< T > & operator= (const CImg< T > &img)`
- `CImg< T > & operator= (const CImgDisplay &disp)`

*Operator=()*.

- template<typename t >  
CImg< T > & operator+= (const t val)  
*Operator+=()*.
- CImg< T > & operator+= (const char \*const expression)  
*Operator+=()*.

## Instance Characteristics

- `int width () const`  
*Return the number of columns of the instance image (size along the X-axis, i.e image width).*
- `int height () const`  
*Return the number of rows of the instance image (size along the Y-axis, i.e image height).*
- `int depth () const`  
*Return the number of slices of the instance image (size along the Z-axis).*
- `int spectrum () const`  
*Return the number of vector channels of the instance image (size along the C-axis).*
- `unsigned int size () const`  
*Return the number of image buffer elements.*
- `T * data ()`  
*Return a pointer to the pixel buffer.*
- `const T * data () const`
- `T * data (const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0)`

*Return a pointer to the pixel value located at  $(x, y, z, v)$ .*

- `const T * data (const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0) const`
- `int offset (const int x, const int y=0, const int z=0, const int c=0) const`

*Return the offset of the pixel coordinates  $(x, y, z, v)$  with respect to the data pointer `data`.*

- `iterator begin ()`

*Return an iterator to the first image pixel.*

- `const_iterator begin () const`

- `iterator end ()`

*Return an iterator pointing after the last image pixel (STL-compliant name).*

- `const_iterator end () const`

- `const T & front () const`

*Return reference to the first image pixel (STL-compliant name).*

- `T & front ()`

- `const T & back () const`

*Return a reference to the last image pixel (STL-compliant name).*

- `T & back ()`

- `T & at (const int off, const T out_val)`

*Read a pixel value with Dirichlet boundary conditions.*

- `T at (const int off, const T out_val) const`

- `T & at (const int off)`

*Read a pixel value with Neumann boundary conditions.*

- `T at (const int off) const`

- `T & atX (const int x, const int y, const int z, const int c, const T out_val)`

*Read a pixel value with Dirichlet boundary conditions for the first coordinates  $(x)$ .*

- `T atX (const int x, const int y, const int z, const int c, const T out_val) const`

- `T & atX (const int x, const int y=0, const int z=0, const int c=0)`

*Read a pixel value with Neumann boundary conditions for the first coordinates  $(x)$ .*

- `T atX (const int x, const int y=0, const int z=0, const int c=0) const`

- `T & atXY (const int x, const int y, const int z, const int c, const T out_val)`

*Read a pixel value with Dirichlet boundary conditions for the two first coordinates  $(x, y)$ .*

- `T atXY (const int x, const int y, const int z, const int c, const T out_val) const`

- `T & atXY (const int x, const int y, const int z=0, const int c=0)`

*Read a pixel value with Neumann boundary conditions for the two first coordinates  $(x, y)$ .*

- `T atXY (const int x, const int y, const int z=0, const int c=0) const`

- `T & atXYZ (const int x, const int y, const int z, const int c, const T out_val)`

*Read a pixel value with Dirichlet boundary conditions for the three first coordinates  $(x, y, z)$ .*

- T **atXYZ** (const int x, const int y, const int z, const int c, const T out\_val) const
- T & **atXYZ** (const int x, const int y, const int z, const int c=0)  
*Read a pixel value with Neumann boundary conditions for the three first coordinates (x,y,z).*
- T **atXYZ** (const int x, const int y, const int z, const int c=0) const
- T & **atXYZC** (const int x, const int y, const int z, const int c, const T out\_val)  
*Read a pixel value with Dirichlet boundary conditions.*

### 8.1.1 Detailed Description

**template<typename T> struct cimg\_library::CImg< T >**

Class representing an image (up to 4 dimensions wide), each pixel being of type T. This is the main class of the CImg Library. It declares and constructs an image, allows access to its pixel values, and is able to perform various image operations.

#### Image representation

A CImg image is defined as an instance of the container [CImg<T>](#), which contains a regular grid of pixels, each pixel value being of type T. The image grid can have up to 4 dimensions : width, height, depth and number of channels. Usually, the three first dimensions are used to describe spatial coordinates (x, y, z), while the number of channels is rather used as a vector-valued dimension (it may describe the R,G,B color channels for instance). If you need a fifth dimension, you can use image lists [CImgList<T>](#) rather than simple images [CImg<T>](#).

Thus, the [CImg<T>](#) class is able to represent volumetric images of vector-valued pixels, as well as images with less dimensions (1d scalar signal, 2d color images, ...). Most member functions of the class [CImg<T>](#) are designed to handle this maximum case of (3+1) dimensions.

Concerning the pixel value type T : fully supported template types are the basic C++ types : unsigned char, char, short, unsigned int, int, unsigned long, long, float, double, ... . Typically, fast image display can be done using [CImg<unsigned](#)

`char`> images, while complex image processing algorithms may be rather coded using `CImg<float>` or `CImg<double>` images that have floating-point pixel values. The default value for the template `T` is `float`. Using your own template types may be possible. However, you will certainly have to define the complete set of arithmetic and logical operators for your class.

### Image structure

The `CImg<T>` structure contains *six* fields :

- `width` defines the number of *columns* of the image (size along the X-axis).
- `height` defines the number of *rows* of the image (size along the Y-axis).
- `depth` defines the number of *slices* of the image (size along the Z-axis).
- `spectrum` defines the number of *channels* of the image (size along the C-axis).
- `data` defines a *pointer* to the *pixel data* (of type `T`).
- `is_shared` is a boolean that tells if the memory buffer `data` is shared with another image.

You can access these fields publicly although it is recommended to use the dedicated functions `width()`, `height()`, `depth()`, `spectrum()` and `ptr()` to do so. Image dimensions are not limited to a specific range (as long as you got enough available memory). A value of `1` usually means that the corresponding dimension is *flat*. If one of the dimensions is `0`, or if the data pointer is null, the image is considered as *empty*. Empty images should not contain any pixel data and thus, will not be processed by `CImg` member functions (a `CImgInstanceException` will be thrown instead). Pixel data are stored in memory, in a non interlaced mode (See [How pixel data are stored with CImg.](#)).

### Image declaration and construction

Declaring an image can be done by using one of the several available constructors. Here is a list of the most used :

- Construct images from arbitrary dimensions :
  - `CImg<char> img;` declares an empty image.
  - `CImg<unsigned char> img(128,128);` declares a 128x128 greyscale image with unsigned char pixel values.
  - `CImg<double> img(3,3);` declares a 3x3 matrix with double coefficients.
  - `CImg<unsigned char> img(256,256,1,3);` declares a 256x256x1x3 (color) image (colors are stored as an image with three channels).
  - `CImg<double> img(128,128,128);` declares a 128x128x128 volumetric and greyscale image (with double pixel values).
  - `CImg<> img(128,128,128,3);` declares a 128x128x128 volumetric color image (with float pixels, which is the default value of the template parameter `T`).
  - **Note** : images pixels are **not automatically initialized to 0**. You may use the function `fill()` to do it, or use the specific constructor taking 5 parameters like this : `CImg<> img(128,128,128,3,0);` declares a 128x128x128 volumetric color image with all pixel values to 0.

- Construct images from filenames :
  - `CImg<unsigned char> img("image.jpg");` reads a JPEG color image from the file "image.jpg".
  - `CImg<float> img("analyze.hdr");` reads a volumetric image (ANALYZE7.5 format) from the file "analyze.hdr".
  - **Note** : You need to install [ImageMagick](#) to be able to read common compressed image formats (JPG,PNG, ...) (See [Files IO in CImg](#)).
- Construct images from C-style arrays :
  - `CImg<int> img(data_buffer,256,256);` constructs a 256x256 greyscale image from a `int* buffer data_buffer` (of size 256x256=65536).
  - `CImg<unsigned char> img(data_buffer,256,256,1,3,false);` constructs a 256x256 color image from a `unsigned char* buffer data_buffer` (where R,G,B channels follow each others).
  - `CImg<unsigned char> img(data_buffer,256,256,1,3,true);` constructs a 256x256 color image from a `unsigned char* buffer data_buffer` (where R,G,B channels are multiplexed).

The complete list of constructors can be found [here](#).

### Most useful functions

The `CImg<T>` class contains a lot of functions that operates on images. Some of the most useful are :

- `operator()()` : allows to access or write pixel values.
- `display()` : displays the image in a new window.

## 8.1.2 Member Typedef Documentation

### 8.1.2.1 `typedef T* iterator`

Iterator type for `CImg<T>`.

#### Remarks

- An `iterator` is a `T*` pointer (address of a pixel value in the pixel buffer).
- Iterators are not directly used in `CImg` functions, they have been introduced for compatibility with the STL.

### 8.1.2.2 `typedef const T* const_iterator`

Const iterator type for `CImg<T>`.

#### Remarks

- A `const_iterator` is a `const T*` pointer (address of a pixel value in the pixel buffer).
- Iterators are not directly used in `CImg` functions, they have been introduced for compatibility with the STL.

### 8.1.3 Constructor & Destructor Documentation

#### 8.1.3.1 `~CImg ( )`

Destructor.

The destructor destroys the instance image.

##### Remarks

- Destructing an empty or shared image does nothing.
- Otherwise, all memory used to store the pixel data of the instance image is freed.
- When destroying a non-shared image, be sure that every shared instances of the same image are also destroyed to avoid further access to deallocated memory buffers.

#### 8.1.3.2 `CImg ( )`

Default constructor.

The default constructor creates an empty instance image.

##### Remarks

- An empty image does not contain any data and has all of its dimensions [width](#), [height](#), [depth](#), [spectrum](#) set to 0 as well as its pointer to the pixel buffer [data](#).
- An empty image is non-shared.

#### 8.1.3.3 `CImg ( const unsigned int dx, const unsigned int dy = 1, const unsigned int dz = 1, const unsigned int dc = 1 ) [explicit]`

Constructs a new image with given size (dx,dy,dz,dc).

This constructors create an instance image of size (dx,dy,dz,dc) with pixels of type T.

##### Parameters

- dx** Desired size along the X-axis, i.e. the [width](#) of the image.
- dy** Desired size along the Y-axis, i.e. the [height](#) of the image.
- dz** Desired size along the Z-axis, i.e. the [depth](#) of the image.
- dc** Desired size along the C-axis, i.e. the number of image channels [spectrum](#).

##### Remarks

- If one of the input dimension dx,dy,dz or dc is set to 0, the created image is empty and all has its dimensions set to 0. No memory for pixel data is then allocated.
- This constructor creates only non-shared images.
- Image pixels allocated by this constructor are **not initialized**. Use the constructor [CImg\(const unsigned int,const unsigned int,const unsigned int,const unsigned int,const T\)](#) to get an image of desired size with pixels set to a particular value.

#### 8.1.3.4 CImg ( const unsigned int *dx*, const unsigned int *dy*, const unsigned int *dz*, const unsigned int *dc*, const T *val* )

Construct an image with given size (*dx*,*dy*,*dz*,*dc*) and with pixel having a default value *val*.

This constructor creates an instance image of size (*dx*,*dy*,*dz*,*dc*) with pixels of type T and sets all pixel values of the created instance image to *val*.

##### Parameters

- dx* Desired size along the X-axis, i.e. the [width](#) of the image.
- dy* Desired size along the Y-axis, i.e. the [height](#) of the image.
- dz* Desired size along the Z-axis, i.e. the [depth](#) of the image.
- dc* Desired size along the C-axis, i.e. the number of image channels [spectrum](#).
- val* Default value for image pixels.

##### Remarks

- This constructor has the same properties as [CImg\(const unsigned int,const unsigned int,const unsigned int,const unsigned int\)](#).

#### 8.1.3.5 CImg ( const t \*const *data\_buffer*, const unsigned int *dx*, const unsigned int *dy* = 1, const unsigned int *dz* = 1, const unsigned int *dc* = 1, const bool *shared* = *false* )

Construct an image from a raw memory buffer.

This constructor creates an instance image of size (*dx*,*dy*,*dz*,*dc*) and fill its pixel buffer by copying data values from the input raw pixel buffer *data\_buffer*.

#### 8.1.3.6 CImg ( const char \*const *filename* ) [explicit]

Construct an image from an image file.

This constructor creates an instance image by reading it from a file.

##### Parameters

- filename* Filename of the image file.

##### Remarks

- The image format is deduced from the filename only by looking for the filename extension i.e. without analyzing the file itself.
- Recognized image formats depend on the tools installed on your system or the external libraries you use to link your code with. More informations on this topic can be found in [cimg\\_files\\_io](#).
- If the filename is not found, a CImgIOException is thrown by this constructor.

#### 8.1.3.7 CImg ( const CImg< t > & *img* )

Default copy constructor.

The default copy constructor creates a new instance image having same dimensions ([width](#), [height](#), [depth](#), [\\_spectrum](#)) and same pixel values as the input image *img*.

**Parameters**

*img* The input image to copy.

**Remarks**

- If the input image *img* is non-shared or have a different template type  $t \neq T$ , the default copy constructor allocates a new pixel buffer and copy the pixel data of *img* into it. In this case, the pointers [data](#) to the pixel buffers of the two images are different and the resulting instance image is non-shared.
- If the input image *img* is shared and has the same template type  $t == T$ , the default copy constructor does not allocate a new pixel buffer and the resulting instance image shares its pixel buffer with the input image *img*, which means that modifying pixels of *img* also modifies the created instance image.
- Copying an image having a different template type  $t \neq T$  performs a crude static cast conversion of each pixel value from type  $t$  to type  $T$ .
- Copying an image having the same template type  $t == T$  is significantly faster.

**8.1.3.8 CImg ( const CImg< t > & *img*, const bool *shared* )**

Advanced copy constructor.

The advanced copy constructor - as the default constructor [CImg\(const CImg< t >&\)](#) - creates a new instance image having same dimensions [width](#), [height](#), [depth](#), [spectrum](#) and same pixel values as the input image *img*. But it also decides if the created instance image shares its memory with the input image *img* (if the input parameter *shared* is set to `true`) or not (if the input parameter *shared* is set to `false`).

**Parameters**

*img* The input image to copy.

*shared* Boolean flag that decides if the copy is shared on non-shared.

**Remarks**

- It is not possible to create a shared copy if the input image *img* is empty or has a different pixel type  $t \neq T$ .
- If a non-shared copy of the input image *img* is created, a new memory buffer is allocated for pixel data.
- If a shared copy of the input image *img* is created, no extra memory is allocated and the pixel buffer of the instance image is the same as the one used by the input image *img*.

**8.1.4 Member Function Documentation****8.1.4.1 CImg<T>& clear ( )**

In-place version of the default constructor (STL-compliant name).

This function is strictly equivalent to [assign\(\)](#) and has been introduced for having a STL-compatible function name.

**8.1.4.2 CImg<T>& assign ( )**

In-place version of the default constructor/destructor.

This function replaces the instance image by an empty image.

**Remarks**

- Memory used by the previous content of the instance image is freed if necessary.
- If the instance image was initially shared, it is replaced by a (non-shared) empty image.
- This function is useful to free memory used by an image that is not of use, but which has been created in the current code scope (i.e. not destroyed yet).

**8.1.4.3 CImg<T>& assign ( const unsigned int dx, const unsigned int dy = 1, const unsigned int dz = 1, const unsigned int dc = 1 )**

In-place version of the previous constructor.

This function replaces the instance image by a new image of size (dx,dy,dz,dc) with pixels of type T.

**Parameters**

**dx** Desired size along the X-axis, i.e. the [width](#) of the image.

**dy** Desired size along the Y-axis, i.e. the [height](#) of the image.

**dz** Desired size along the Z-axis, i.e. the [depth](#) of the image.

**dc** Desired size along the C-axis, i.e. the number of image channels `_spectrum`.

- If one of the input dimension dx,dy,dz or dc is set to 0, the instance image becomes empty and all has its dimensions set to 0. No memory for pixel data is then allocated.
- Memory buffer used to store previous pixel values is freed if necessary.
- If the instance image is shared, this constructor actually does nothing more than verifying that new and old image dimensions fit.
- Image pixels allocated by this function are **not initialized**. Use the function [assign\(const unsigned int,const unsigned int,const unsigned int,const unsigned int,const T\)](#) to assign an image of desired size with pixels set to a particular value.

**8.1.4.4 CImg<T>& assign ( const unsigned int dx, const unsigned int dy, const unsigned int dz, const unsigned int dc, const T val )**

In-place version of the previous constructor.

This function replaces the instance image by a new image of size (dx,dy,dz,dc) with pixels of type T and sets all pixel values of the instance image to `val`.

**Parameters**

**dx** Desired size along the X-axis, i.e. the [width](#) of the image.

**dy** Desired size along the Y-axis, i.e. the [height](#) of the image.

**dz** Desired size along the Z-axis, i.e. the [depth](#) of the image.

**dc** Desired size along the C-axis, i.e. the number of image channels `_spectrum`.

**val** Default value for image pixels.

**Remarks**

- This function has the same properties as [assign\(const unsigned int,const unsigned int,const unsigned int,const unsigned int\)](#).

**8.1.4.5 CImg<T>& assign ( const char \*const *filename* )**

In-place version of the previous constructor.

This function replaces the instance image by the one that have been read from the given file.

**Parameters**

*filename* Filename of the image file.

- The image format is deduced from the filename only by looking for the filename extension i.e. without analyzing the file itself.
- Recognized image formats depend on the tools installed on your system or the external libraries you use to link your code with. More informations on this topic can be found in `cimg_files_io`.
- If the filename is not found, a `CImgIOException` is thrown by this constructor.

**8.1.4.6 CImg<T>& assign ( const CImg< t > & *img* )**

In-place version of the default copy constructor.

This function assigns a copy of the input image `img` to the current instance image.

**Parameters**

*img* The input image to copy.

**Remarks**

- If the instance image is non-shared, the content of the input image `img` is copied into a new buffer becoming the new pixel buffer of the instance image, while the old pixel buffer is freed if necessary.
- If the instance image is shared, the content of the input image `img` is copied into the current (shared) pixel buffer of the instance image, modifying then the image referenced by the shared instance image. The instance image still remains shared.

**8.1.4.7 CImg<T>& assign ( const CImg< t > & *img*, const bool *shared* )**

In-place version of the advanced constructor.

This function - as the simpler function [assign\(const CImg< t >&\)](#) - assigns a copy of the input image `img` to the current instance image. But it also decides if the copy is shared (if the input parameter `shared` is set to `true`) or non-shared (if the input parameter `shared` is set to `false`).

**Parameters**

*img* The input image to copy.

*shared* Boolean flag that decides if the copy is shared or non-shared.

**Remarks**

- It is not possible to assign a shared copy if the input image `img` is empty or has a different pixel type `t != T`.
- If a non-shared copy of the input image `img` is assigned, a new memory buffer is allocated for pixel data.
- If a shared copy of the input image `img` is assigned, no extra memory is allocated and the pixel buffer of the instance image is the same as the one used by the input image `img`.

**8.1.4.8 CImg<t>& move\_to ( CImg< t > & img )**

Move the content of the instance image into another one in a way that memory copies are avoided if possible.

The instance image is always empty after a call to this function.

**8.1.4.9 T& operator() ( const unsigned int x, const unsigned int y = 0, const unsigned int z = 0, const unsigned int c = 0 )**

Fast access to pixel value for reading or writing.

**Parameters**

- `x` X-coordinate of the pixel.
- `y` Y-coordinate of the pixel.
- `z` Z-coordinate of the pixel.
- `v` C-coordinate of the pixel.

- If one image dimension is equal to 1, it can be omitted in the coordinate list (see example below).
- If the macro `'cimg_verbosity'>=3`, boundary checking is performed and warning messages may appear (but function performances decrease).

**example:**

```
CImg<float> img(100,100,1,3,0);           // Define a 100x100
color image with float-valued black pixels.
const float valR = img(10,10,0,0);       // Read the red comp
onent at coordinates (10,10).
const float valG = img(10,10,0,1);       // Read the green co
mponent at coordinates (10,10)
const float valB = img(10,10,2);         // Read the blue com
ponent at coordinates (10,10) (Z-coordinate omitted here).
const float avg = (valR + valG + valB)/3; // Compute average p
ixel value.
img(10,10,0) = img(10,10,1) = img(10,10,2) = avg; // Replace the pixel
(10,10) by the average grey value.
```

**8.1.4.10 CImg<T>& operator= ( const T val )**

Operator=().

Assignment operator. Fill all pixels of the instance image with the same value. The image size is not modified.

**8.1.4.11 CImg<T>& operator= ( const char \*const *expression* )**

Operator=().

Assignment operator. If *expression* is a formula or a list of values, the image pixels are filled according to the expression and the image size is not modified. If *expression* is a filename, the image is replaced by the input file data (so image size is modified).

**8.1.4.12 CImg<T>& operator= ( const CImg< t > & *img* )**

Operator=().

Assignment operator. If instance image is non-shared, replace the instance image by a copy of the argument image. If instance image is shared, replace the image content by the content of the argument image.

**8.1.4.13 CImg<T> operator+ ( ) const**

Operator+() (unary).

**Remarks**

- This operator always returns a non-shared copy of an image.

**8.1.4.14 static const char\* pixel\_type ( ) [static]**

Return the type of the pixel values.

**Returns**

a string describing the type of the image pixels (template parameter T).

- The string returned may contains spaces ("unsigned char").
- If the template parameter T does not correspond to a registered type, the string "unknown" is returned.

**8.1.4.15 unsigned int size ( ) const**

Return the number of image buffer elements.

- Equivalent to : `width() * height() * depth() * spectrum()`.

**example:**

```
CImg<> img(100,100,1,3);
if (img.size()==100*100*3) std::fprintf(stderr,"This statement is true");
```

#### 8.1.4.16 T\* data ( const unsigned int x, const unsigned int y = 0, const unsigned int z = 0, const unsigned int c = 0 )

Return a pointer to the pixel value located at (x,y,z,v).

##### Parameters

- x* X-coordinate of the pixel.
- y* Y-coordinate of the pixel.
- z* Z-coordinate of the pixel.
- v* C-coordinate of the pixel.

- When called without parameters, `data()` returns a pointer to the begining of the pixel buffer.
- If the macro '`cimg_verbosity`'>=3, boundary checking is performed and warning messages may appear if given coordinates are outside the image range (but function performances decrease).

##### example:

```
CImg<float> img(100,100,1,1,0); // Define a 100x100 greyscale image with
float-valued pixels.
float *ptr = data(10,10);      // Get a pointer to the pixel located at
(10,10).
float val = *ptr;              // Get the pixel value.
```

#### 8.1.4.17 int offset ( const int x, const int y = 0, const int z = 0, const int c = 0 ) const

Return the offset of the pixel coordinates (x,y,z,v) with respect to the data pointer data.

##### Parameters

- x* X-coordinate of the pixel.
- y* Y-coordinate of the pixel.
- z* Z-coordinate of the pixel.
- v* C-coordinate of the pixel.

- No checking is done on the validity of the given coordinates.

##### Example:

```
CImg<float> img(100,100,1,3,0); // Define a 100x100 color image wi
th float-valued black pixels.
long off = img.offset(10,10,0,2); // Get the offset of the blue valu
e of the pixel located at (10,10).
float val = img[off];            // Get the blue value of the pixel
.
```

#### 8.1.4.18 Tdouble variance ( const unsigned int variance\_method = 1 ) const

Return the variance of the image.

**Parameters**

***variance\_method*** Determines how to calculate the variance

0	Second moment: $v = 1/N \sum_{k=1}^N (x_k - \bar{x})^2 = 1/N \left( \sum_{k=1}^N x_k^2 - \left( \sum_{k=1}^N x_k \right)^2 / N \right)$ with $\bar{x} = 1/N \sum_{k=1}^N x_k$
1	Best unbiased estimator: $v = \frac{1}{N-1} \sum_{k=1}^N (x_k - \bar{x})^2$
2	Least median of squares
3	Least trimmed of squares

**8.1.4.19** `double eval ( const char *const expression, const double x = 0, const double y = 0, const double z = 0, const double c = 0 ) const`

Evaluate math expression.

If you make successive evaluations on the same image and with the same expression, you can set 'expr' to 0 after the first call, to skip the math parsing step.

**8.1.4.20** `static CImg<T> dijkstra ( const tf & distance, const unsigned int nb_nodes, const unsigned int starting_node, const unsigned int ending_node, CImg< t > & previous ) [static]`

Compute minimal path in a graph, using the Dijkstra algorithm.

**Parameters**

***distance*** An object having operator()(unsigned int i, unsigned int j) which returns distance between two nodes (i,j).

***nb\_nodes*** Number of graph nodes.

***starting\_node*** Indice of the starting node.

***ending\_node*** Indice of the ending node (set to ~0U to ignore ending node).

***previous*** Array that gives the previous node indice in the path to the starting node (optional parameter).

**Returns**

Array of distances of each node to the starting node.

**8.1.4.21** `CImg<T>& dijkstra ( const unsigned int starting_node, const unsigned int ending_node, CImg< t > & previous )`

Return minimal path in a graph, using the Dijkstra algorithm.

Instance image corresponds to the adjacency matrix of the graph.

**Parameters**

***starting\_node*** Indice of the starting node.

*previous* Array that gives the previous node indice in the path to the starting node (optional parameter).

### Returns

Array of distances of each node to the starting node.

**8.1.4.22** `static CImg<floatT> streamline ( const tfunc & func, const float x, const float y, const float z, const float L = 256, const float dl = 0.1f, const unsigned int interpolation_type = 2, const bool is_backward_tracking = false, const bool is_oriented_only = false, const float x0 = 0, const float y0 = 0, const float z0 = 0, const float x1 = 0, const float y1 = 0, const float z1 = 0 ) [static]`

Return stream line of a 3d vector field.

### Parameters

*interpolation\_type* Type of interpolation (can be 0=nearest int, 1=linear, 2=2nd-order RK, 3=4th-order RK).

**8.1.4.23** `CImg<T>& fill ( const T val )`

Fill an image by a value *val*.

### Parameters

*val* = fill value

### Note

All pixel values of the instance image will be initialized by *val*.

**8.1.4.24** `CImg<T>& round ( const double y = 1, const int rounding_type = 0 )`

Compute image with rounded pixel values.

### Parameters

*y* Rounding precision.

*rounding\_type* Roundin type, can be 0 (nearest), 1 (forward), -1(backward).

**8.1.4.25** `CImg<T>& noise ( const double sigma, const unsigned int noise_type = 0 )`

Add random noise to the values of the instance image.

### Parameters

*sigma* Amplitude of the random additive noise. If *sigma*<0, it stands for a percentage of the global value range.

*noise\_type* Type of additive noise (can be 0=gaussian, 1=uniform, 2=Salt and Pepper, 3=Poisson or 4=Rician).

**Returns**

A reference to the modified instance image.

**Note**

- For Poisson noise (`noise_type=3`), parameter `sigma` is ignored, as Poisson noise only depends on the image value itself.
- Function `CImg<T>::get_noise()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_noise(40);
(img,res.normalize(0,255)).display();
```

**8.1.4.26 CImg<T>& normalize ( const T value\_min, const T value\_max )**

Linearly normalize values of the instance image between `value_min` and `value_max`.

**Parameters**

***value\_min*** Minimum desired value of the resulting image.

***value\_max*** Maximum desired value of the resulting image.

**Returns**

A reference to the modified instance image.

**Note**

- Function `CImg<T>::get_normalize()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_normalize(160,220);
(img,res).display();
```

**8.1.4.27 CImg<T>& normalize ( )**

Normalize multi-valued pixels of the instance image, with respect to their L2-norm.

**Returns**

A reference to the modified instance image.

**Note**

- Function `CImg<T>::get_normalize()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_normalize();
(img,res.normalize(0,255)).display();
```

#### 8.1.4.28 CImg<T>& norm ( const int *norm\_type* = 2 )

Compute L2-norm of each multi-valued pixel of the instance image.

##### Parameters

*norm\_type* Type of computed vector norm (can be 0=Linf, 1=L1 or 2=L2).

##### Returns

A reference to the modified instance image.

##### Note

- Function `CImg<T>::get_norm()` is also defined. It returns a non-shared modified copy of the instance image.

##### Sample code :

```
const CImg<float> img("reference.jpg"), res = img.get_norm();
(img,res).normalize(0,255).display();
```

#### 8.1.4.29 CImg<T>& cut ( const T *value\_min*, const T *value\_max* )

Cut values of the instance image between *value\_min* and *value\_max*.

##### Parameters

*value\_min* Minimum desired value of the resulting image.

*value\_max* Maximum desired value of the resulting image.

##### Returns

A reference to the modified instance image.

##### Note

- Function `CImg<T>::get_cut()` is also defined. It returns a non-shared modified copy of the instance image.

##### Sample code :

```
const CImg<float> img("reference.jpg"), res = img.get_cut(160,220);
(img,res).display();
```

#### 8.1.4.30 CImg<T>& quantize ( const unsigned int *nb\_levels*, const bool *keep\_range* = true )

Uniformly quantize values of the instance image into *nb\_levels* levels.

##### Parameters

*nb\_levels* Number of quantization levels.

*keep\_range* Tells if resulting values keep the same range as the original ones.

**Returns**

A reference to the modified instance image.

**Note**

- Function `CImg<T>::get_quantize()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_quantize(4);
(img,res).display();
```

#### 8.1.4.31 `CImg<T>& threshold ( const T value, const bool soft_threshold = false, const bool strict_threshold = false )`

Threshold values of the instance image.

**Parameters**

*value* Threshold value

*soft\_threshold* Tells if soft thresholding must be applied (instead of hard one).

*strict\_threshold* Tells if threshold value is strict.

**Returns**

A reference to the modified instance image. Resulting pixel values are either equal to 0 or 1.

**Note**

- Function `CImg<T>::get_threshold()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_threshold(128);
(img,res.normalize(0,255)).display();
```

#### 8.1.4.32 `CImg<T>& histogram ( const unsigned int nb_levels, const T value_min = (T) 0, const T value_max = (T) 0 )`

Compute the histogram of the instance image.

**Parameters**

*nb\_levels* Number of desired histogram levels.

*value\_min* Minimum pixel value considered for the histogram computation. All pixel values lower than *value\_min* will not be counted.

*value\_max* Maximum pixel value considered for the histogram computation. All pixel values higher than *value\_max* will not be counted.

**Returns**

Instance image is replaced by its histogram, defined as a `CImg<T> (nb_levels)` image.

**Note**

- The histogram  $H$  of an image  $I$  is the 1d function where  $H(x)$  counts the number of occurrences of the value  $x$  in the image  $I$ .
- If `value_min==value_max==0` (default behavior), the function first estimates the whole range of pixel values then uses it to compute the histogram.
- The resulting histogram is always defined in 1d. Histograms of multi-valued images are not multi-dimensional.
- Function `CImg<T>::get_histogram()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img = CImg<float>("reference.jpg").histogram(256);
img.display_graph(0,3);
```

### 8.1.4.33 CImg<T>& equalize ( const unsigned int *nb\_levels*, const T *value\_min* = (T) 0, const T *value\_max* = (T) 0 )

Compute the histogram-equalized version of the instance image.

**Parameters**

***nb\_levels*** Number of histogram levels used for the equalization.

***value\_min*** Minimum pixel value considered for the histogram computation. All pixel values lower than *value\_min* will not be counted.

***value\_max*** Maximum pixel value considered for the histogram computation. All pixel values higher than *value\_max* will not be counted.

**Returns**

A reference to the modified instance image.

**Note**

- If `value_min==value_max==0` (default behavior), the function first estimates the whole range of pixel values then uses it to equalize the histogram.
- Function `CImg<T>::get_equalize()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img("reference.jpg"), res = img.get_equalize(256);
(img,res).display();
```

### 8.1.4.34 CImg<T>& index ( const CImg< t > & *palette*, const bool *dithering* = *false*, const bool *map\_indexes* = *false* )

Index multi-valued pixels of the instance image, regarding to a predefined palette.

**Parameters**

***palette*** Multi-valued palette used as the basis for multi-valued pixel indexing.

*dithering* Tells if Floyd-Steinberg dithering is activated or not.

*map\_indexes* Tell if the values of the resulting image are the palette indices or the palette vectors.

### Returns

A reference to the modified instance image.

### Note

- `img.index(palette, dithering, 1)` is equivalent to `img.index(palette, dithering, 0).map(palette)`.
- Function `CImg<T>::get_index()` is also defined. It returns a non-shared modified copy of the instance image.

### Sample code :

```
const CImg<float> img("reference.jpg"), palette(3,1,1,3, 0,128,255, 0,128,
255, 0,128,255);
const CImg<float> res = img.get_index(palette,true,true);
(img,res).display();
```

#### 8.1.4.35 CImg<T>& map ( const CImg< t > & palette )

Map predefined palette on the scalar (indexed) instance image.

### Parameters

*palette* Multi-valued palette used for mapping the indexes.

### Returns

A reference to the modified instance image.

### Note

- Function `CImg<T>::get_map()` is also defined. It returns a non-shared modified copy of the instance image.

### Sample code :

```
const CImg<float> img("reference.jpg"),
palette1(3,1,1,3, 0,128,255, 0,128,255, 0,128,255),
palette2(3,1,1,3, 255,0,0, 0,255,0, 0,0,255),
res = img.get_index(palette1,false).map(palette2);
(img,res).display();
```

#### 8.1.4.36 CImg<T>& label\_regions ( )

Create a map of indexed labels counting disconnected regions with same intensities.

### Returns

A reference to the modified instance image.

**Note**

- Function `CImg<T>::get_label_regions()` is also defined. It returns a non-shared modified copy of the instance image.

**Sample code :**

```
const CImg<float> img = CImg<float>("reference.jpg").norm().quantize(4),
                        palette = CImg<float>::default_LUT256(),
                        res = img.get_label_regions().normalize(0,255).map(palette);
(img, res).display();
```

**8.1.4.37 CImg<T>& RGBtoHSI ( )**

Convert color pixels from (R,G,B) to (H,S,I). Reference: "Digital Image Processing, 2nd. edition", R. Gonzalez and R. Woods. Prentice Hall, 2002.

**8.1.4.38 CImg<T>& RGBtoBayer ( )**

Convert a (R,G,B) image to a Bayer-coded representation.

**Note**

First (upper-left) pixel if the red component of the pixel color.

**8.1.4.39 CImg<T>& resize ( const int size\_x, const int size\_y = -100, const int size\_z = -100, const int size\_c = -100, const int interpolation\_type = 1, const unsigned int border\_conditions = 0, const float centering\_x = 0, const float centering\_y = 0, const float centering\_z = 0, const float centering\_c = 0 )**

Resize an image.

**Parameters**

*size\_x* Number of columns (new size along the X-axis).

*size\_y* Number of rows (new size along the Y-axis).

*size\_z* Number of slices (new size along the Z-axis).

*size\_c* Number of vector-channels (new size along the C-axis).

*interpolation\_type* Method of interpolation :

- -1 = no interpolation : raw memory resizing.
- 0 = no interpolation : additional space is filled according to *border\_condition*.
- 1 = nearest-neighbor interpolation.
- 2 = moving average interpolation.
- 3 = linear interpolation.
- 4 = grid interpolation.
- 5 = bicubic interpolation.
- 6 = lanczos interpolation.

*border\_conditions* Border condition type.

***centering\_x*** Set centering type (only if *interpolation\_type*=0).

***centering\_y*** Set centering type (only if *interpolation\_type*=0).

***centering\_z*** Set centering type (only if *interpolation\_type*=0).

***centering\_c*** Set centering type (only if *interpolation\_type*=0).

#### Note

If  $pd[x,y,z,v]<0$ , it corresponds to a percentage of the original size (the default value is -100).

#### 8.1.4.40 CImg<T>&resize\_doubleXY ( )

Upscale an image by a factor 2x.

Use anisotropic upscaling algorithm described at <http://scale2x.sourceforge.net/algorithm.html>

#### 8.1.4.41 CImg<T>&resize\_tripleXY ( )

Upscale an image by a factor 3x.

Use anisotropic upscaling algorithm described at <http://scale2x.sourceforge.net/algorithm.html>

#### 8.1.4.42 CImg<T>&shift ( const int *deltax*, const int *deltay* = 0, const int *deltaz* = 0, const int *deltac* = 0, const int *border\_condition* = 0 )

Shift the image.

#### Parameters

***deltax*** Amount of displacement along the X-axis.

***deltay*** Amount of displacement along the Y-axis.

***deltaz*** Amount of displacement along the Z-axis.

***deltac*** Amount of displacement along the C-axis.

***border\_condition*** Border condition.

• *border\_condition* can be :

- 0 : Zero border condition (Dirichlet).
- 1 : Nearest neighbors (Neumann).
- 2 : Repeat Pattern (Fourier style).

#### 8.1.4.43 CImg<T>&permute\_axes ( const char \*const *order* )

Permute axes order.

This function permutes image axes.

#### Parameters

***permut*** = String describing the permutation (4 characters).

#### 8.1.4.44 CImg<T>& rotate ( const float *angle*, const unsigned int *border\_conditions* = 0, const unsigned int *interpolation* = 1 )

Rotate an image.

##### Parameters

*angle* = rotation angle (in degrees).

*cond* = rotation type. can be :

- 0 = zero-value at borders
- 1 = nearest pixel.
- 2 = cyclic.

##### Note

Returned image will probably have a different size than the instance image \*this.

#### 8.1.4.45 CImg<T>& rotate ( const float *angle*, const float *cx*, const float *cy*, const float *zoom*, const unsigned int *border\_conditions* = 3, const unsigned int *interpolation* = 1 )

Rotate an image around a center point (*cx*,*cy*).

##### Parameters

*angle* = rotation angle (in degrees).

*cx* = X-coordinate of the rotation center.

*cy* = Y-coordinate of the rotation center.

*zoom* = zoom.

*cond* = rotation type. can be :

- 0 = zero-value at borders
- 1 = repeat image at borders
- 2 = zero-value at borders and linear interpolation

#### 8.1.4.46 CImg<T>& crop ( const int *x0*, const int *y0*, const int *z0*, const int *c0*, const int *x1*, const int *y1*, const int *z1*, const int *c1*, const bool *border\_condition* = false )

Get a square region of the image.

##### Parameters

*x0* = X-coordinate of the upper-left crop rectangle corner.

*y0* = Y-coordinate of the upper-left crop rectangle corner.

*z0* = Z-coordinate of the upper-left crop rectangle corner.

*c0* = C-coordinate of the upper-left crop rectangle corner.

*x1* = X-coordinate of the lower-right crop rectangle corner.

*y1* = Y-coordinate of the lower-right crop rectangle corner.

*z1* = Z-coordinate of the lower-right crop rectangle corner.

*c1* = C-coordinate of the lower-right crop rectangle corner.

*border\_condition* = Dirichlet (false) or Neumann border conditions.

#### 8.1.4.47 CImg<T>& crop ( const int x0, const int y0, const int z0, const int x1, const int y1, const int z1, const bool border\_condition = false )

Get a rectangular part of the instance image.

##### Parameters

*x0* = X-coordinate of the upper-left crop rectangle corner.  
*y0* = Y-coordinate of the upper-left crop rectangle corner.  
*z0* = Z-coordinate of the upper-left crop rectangle corner.  
*x1* = X-coordinate of the lower-right crop rectangle corner.  
*y1* = Y-coordinate of the lower-right crop rectangle corner.  
*z1* = Z-coordinate of the lower-right crop rectangle corner.  
*border\_condition* = determine the type of border condition if some of the desired region is outside the image.

#### 8.1.4.48 CImg<T>& crop ( const int x0, const int y0, const int x1, const int y1, const bool border\_condition = false )

Get a rectangular part of the instance image.

##### Parameters

*x0* = X-coordinate of the upper-left crop rectangle corner.  
*y0* = Y-coordinate of the upper-left crop rectangle corner.  
*x1* = X-coordinate of the lower-right crop rectangle corner.  
*y1* = Y-coordinate of the lower-right crop rectangle corner.  
*border\_condition* = determine the type of border condition if some of the desired region is outside the image.

#### 8.1.4.49 CImg<T>& crop ( const int x0, const int x1, const bool border\_condition = false )

Get a rectangular part of the instance image.

##### Parameters

*x0* = X-coordinate of the upper-left crop rectangle corner.  
*x1* = X-coordinate of the lower-right crop rectangle corner.  
*border\_condition* = determine the type of border condition if some of the desired region is outside the image.

#### 8.1.4.50 CImg<T>& correlate ( const CImg< t > & mask, const unsigned int border\_conditions = 1, const bool is\_normalized = false )

Compute the correlation of the instance image by a mask.

The correlation of the instance image *\*this* by the mask *mask* is defined to be :

$$\text{res}(x,y,z) = \sum_{\{i,j,k\}} (*this)(x+i,y+j,z+k) * \text{mask}(i,j,k)$$

**Parameters**

*mask* = the correlation kernel.

*border\_conditions* = the border condition type (0=zero, 1=dirichlet)

*is\_normalized* = enable local normalization.

**8.1.4.51 CImg<T>& convolve ( const CImg< t > & mask, const unsigned int border\_conditions = 1, const bool is\_normalized = false )**

Compute the convolution of the image by a mask.

The result *res* of the convolution of an image *img* by a mask *mask* is defined to be :

$$\text{res}(x,y,z) = \sum_{\{i,j,k\}} \text{img}(x-i,y-j,z-k) * \text{mask}(i,j,k)$$

**Parameters**

*mask* = the correlation kernel.

*border\_conditions* = the border condition type (0=zero, 1=dirichlet)

*is\_normalized* = enable local normalization.

**8.1.4.52 CImg<T>& deriche ( const float sigma, const int order = 0, const char axis = 'x', const bool cond = true )**

Compute the result of the Deriche filter.

The Canny-Deriche filter is a recursive algorithm allowing to compute blurred derivatives of order 0,1 or 2 of an image.

**8.1.4.53 CImg<T>& blur ( const float sigmax, const float sigmay, const float sigmaz, const bool cond = true )**

Return a blurred version of the image, using a Canny-Deriche filter.

Blur the image with an anisotropic exponential filter (Deriche filter of order 0).

**8.1.4.54 CImg<T>& blur\_anisotropic ( const CImg< t > & G, const float amplitude = 60, const float dl = 0.8f, const float da = 30, const float gauss\_prec = 2, const unsigned int interpolation\_type = 0, const bool fast\_approx = 1 )**

Blur the image anisotropically following a field of diffusion tensors.

**Parameters**

*G* = Field of square roots of diffusion tensors/vectors used to drive the smoothing.

*amplitude* = amplitude of the smoothing.

*dl* = spatial discretization.

*da* = angular discretization.

*gauss\_prec* = precision of the gaussian function.

*interpolation* Used interpolation scheme (0 = nearest-neighbor, 1 = linear, 2 = Runge-Kutta)

*fast\_approx* = Tell to use the fast approximation or not.

**8.1.4.55** `CImg<T>& blur_bilateral ( const float sigma_x, const float sigma_y, const float sigma_z, const float sigma_r, const int bgrid_x, const int bgrid_y, const int bgrid_z, const int bgrid_r, const bool interpolation_type = true )`

Blur an image using the bilateral filter.

#### Parameters

*sigma\_x* Amount of blur along the X-axis.  
*sigma\_y* Amount of blur along the Y-axis.  
*sigma\_z* Amount of blur along the Z-axis.  
*sigma\_r* Amount of blur along the range axis.  
*bgrid\_x* Size of the bilateral grid along the X-axis.  
*bgrid\_y* Size of the bilateral grid along the Y-axis.  
*bgrid\_z* Size of the bilateral grid along the Z-axis.  
*bgrid\_r* Size of the bilateral grid along the range axis.  
*interpolation\_type* Use interpolation for image slicing.

#### Note

This algorithm uses the optimisation technique proposed by S. Paris and F. Durand, in ECCV'2006 (extended for 3d volumetric images).

**8.1.4.56** `CImgList<Tfloat> get_gradient ( const char *const axes = 0, const int scheme = 3 ) const`

Compute the list of images, corresponding to the XY-gradients of an image.

#### Parameters

*scheme* = Numerical scheme used for the gradient computation :

- -1 = Backward finite differences
- 0 = Centered finite differences
- 1 = Forward finite differences
- 2 = Using Sobel masks
- 3 = Using rotation invariant masks
- 4 = Using Deriche recursive filter.

**8.1.4.57** `CImg<T>& displacement ( const CImg< T > & target, const float smooth = 0.1f, const float precision = 0.1f, const unsigned int nb_scales = 0, const unsigned int iteration_max = 1000, const bool backward = true )`

Estimate a displacement field between instance image and given target image.

#### Parameters

*backward* : if false, match  $I_2(X+U(X)) = I_1(X)$ , else match  $I_2(X) = I_1(X-U(X))$ .

#### 8.1.4.58 CImg<T>& haar ( const char *axis*, const bool *invert* = *false*, const unsigned int *nb\_scales* = 1 )

Compute the Haar multiscale wavelet transform (monodimensional version).

##### Parameters

*axis* Axis considered for the transform.  
*invert* Set inverse of direct transform.  
*nb\_scales* Number of scales used for the transform.

#### 8.1.4.59 CImg<T>& haar ( const bool *invert* = *false*, const unsigned int *nb\_scales* = 1 )

Compute the Haar multiscale wavelet transform.

##### Parameters

*invert* Set inverse of direct transform.  
*nb\_scales* Number of scales used for the transform.

#### 8.1.4.60 CImg<floatT> get\_elevation3d ( CImgList< tf > & *primitives*, CImgList< tc > & *colors*, const CImg< te > & *elevation* ) const

Create and return a 3d elevation of the instance image.

##### Parameters

[out] *primitives* The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).  
[out] *colors* The returned list of the 3d object colors.  
*elevation* The input elevation map.

##### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

##### Sample code :

```
const CImg<float> img("reference.jpg");
CImgList<unsigned int> faces3d;
CImgList<unsigned char> colors3d;
const CImg<float> points3d = img.get_elevation3d(faces3d, colors, img.get_norm() * 0.2);
CImg<unsigned char>().display_object3d("Elevation3d", points3d, faces3d, colors3d);
```

#### 8.1.4.61 CImg<floatT> get\_isoline3d ( CImgList< tf > & *primitives*, const float *isovalue*, const int *size\_x* = -100, const int *size\_y* = -100 ) const

Create and return a isoline of the instance image as a 3d object.

**Parameters**

[out] **primitives** The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

**isovalue** The returned list of the 3d object colors.

**size\_x** The number of subdivisions along the X-axis.

**size\_y** The number of subdivisions along the Y-axis.

**Returns**

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

**Sample code :**

```
const CImg<float> img("reference.jpg");
CImgList<unsigned int> faces3d;
const CImg<float> points3d = img.get_isoline3d(faces3d,100);
CImg<unsigned char>().display_object3d("Isoline3d",points3d,faces3d,colors3d);
```

#### 8.1.4.62 CImg<floatT> get\_isosurface3d ( CImgList< tf > & primitives, const float isovalue, const int size\_x = -100, const int size\_y = -100, const int size\_z = -100 ) const

Create and return a isosurface of the instance image as a 3d object.

**Parameters**

[out] **primitives** The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

**isovalue** The returned list of the 3d object colors.

**size\_x** The number of subdivisions along the X-axis.

**size\_y** The number of subdivisions along the Y-axis.

**Returns**

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

**Sample code :**

```
const CImg<float> img = CImg<unsigned char>("reference.jpg").resize(-100,-100,20);
CImgList<unsigned int> faces3d;
const CImg<float> points3d = img.get_isosurface3d(faces3d,100);
CImg<unsigned char>().display_object3d("Isosurface3d",points3d,faces3d,colors3d);
```

#### 8.1.4.63 static CImg<floatT> box3d ( CImgList< tf > & primitives, const float size\_x = 200, const float size\_y = 100, const float size\_z = 100 ) [static]

Create and return a 3d box object.

**Parameters**

[out] **primitives** The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

*size\_x* The width of the box (dimension along the X-axis).

*size\_y* The height of the box (dimension along the Y-axis).

*size\_z* The depth of the box (dimension along the Z-axis).

### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

### Sample code :

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::box3d(faces3d,10,20,30);
CImg<unsigned char>().display_object3d("Box3d",points3d,faces3d);
```

#### 8.1.4.64 static CImg<floatT> cone3d ( CImgList< tf > & *primitives*, const float *radius* = 50, const float *size\_z* = 100, const unsigned int *subdivisions* = 24 ) [static]

Create and return a 3d cone.

### Parameters

[out] *primitives* The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

*radius* The radius of the cone basis.

*size\_z* The cone's height.

*subdivisions* The number of basis angular subdivisions.

### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

### Sample code :

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::cone3d(faces3d,50);
CImg<unsigned char>().display_object3d("Cone3d",points3d,faces3d);
```

#### 8.1.4.65 static CImg<floatT> cylinder3d ( CImgList< tf > & *primitives*, const float *radius* = 50, const float *size\_z* = 100, const unsigned int *subdivisions* = 24 ) [static]

Create and return a 3d cylinder.

### Parameters

[out] *primitives* The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

*radius* The radius of the cylinder basis.

*size\_z* The cylinder's height.

*subdivisions* The number of basis angular subdivisions.

### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

**Sample code :**

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::cylinder3d(faces3d,50);
CImg<unsigned char>().display_object3d("Cylinder3d",points3d,faces3d);
```

**8.1.4.66** `static CImg<floatT> torus3d ( CImgList< tf > & primitives, const float radius1 = 100, const float radius2 = 30, const unsigned int subdivisions1 = 24, const unsigned int subdivisions2 = 12 ) [static]`

Create and return a 3d torus.

**Parameters**

[out] **primitives** The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

**radius1** The large radius.

**radius2** The small radius.

**subdivisions1** The number of angular subdivisions for the large radius.

**subdivisions2** The number of angular subdivisions for the small radius.

**Returns**

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

**Sample code :**

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::torus3d(faces3d,20,4);
CImg<unsigned char>().display_object3d("Torus3d",points3d,faces3d);
```

**8.1.4.67** `static CImg<floatT> plane3d ( CImgList< tf > & primitives, const float size_x = 100, const float size_y = 100, const unsigned int subdivisions_x = 10, const unsigned int subdivisions_y = 10 ) [static]`

Create and return a 3d XY-plane.

**Parameters**

[out] **primitives** The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

**size\_x** The width of the plane (dimension along the X-axis).

**size\_y** The height of the plane (dimensions along the Y-axis).

**subdivisions\_x** The number of planar subdivisions along the X-axis.

**subdivisions\_y** The number of planar subdivisions along the Y-axis.

**Returns**

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

**Sample code :**

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::plane3d(faces3d,100,50);
CImg<unsigned char>().display_object3d("Plane3d",points3d,faces3d);
```

#### 8.1.4.68 static CImg<floatT> sphere3d ( CImgList< tf > & *primitives*, const float *radius* = 50, const unsigned int *subdivisions* = 3 ) [static]

Create and return a 3d sphere.

##### Parameters

[out] *primitives* The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

*radius* The radius of the sphere (dimension along the X-axis).

*subdivisions* The number of recursive subdivisions from an initial icosahedron.

##### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

##### Sample code :

```
CImgList<unsigned int> faces3d;
const CImg<float> points3d = CImg<float>::sphere3d(faces3d,100,4);
CImg<unsigned char>().display_object3d("Sphere3d",points3d,faces3d);
```

#### 8.1.4.69 static CImg<floatT> ellipsoid3d ( CImgList< tf > & *primitives*, const CImg< t > & *tensor*, const unsigned int *subdivisions* = 3 ) [static]

Create and return a 3d ellipsoid.

##### Parameters

[out] *primitives* The returned list of the 3d object primitives (template type *tf* should be at least *unsigned int*).

*tensor* The tensor which gives the shape and size of the ellipsoid.

*subdivisions* The number of recursive subdivisions from an initial stretched icosahedron.

##### Returns

The N vertices (xi,yi,zi) of the 3d object as a Nx3 CImg<float> image (0<=i<=N-1).

##### Sample code :

```
CImgList<unsigned int> faces3d;
const CImg<float> tensor = CImg<float>::diagonal(10,7,3),
points3d = CImg<float>::ellipsoid3d(faces3d,tensor,4);
CImg<unsigned char>().display_object3d("Ellipsoid3d",points3d,faces3d);
```

#### 8.1.4.70 CImg<T>& draw\_point ( const int *x0*, const int *y0*, const tc \*const *color*, const float *opacity* = 1 )

Draw a 2d colored point (pixel).

##### Parameters

*x0* X-coordinate of the point.

*y0* Y-coordinate of the point.

*color* Pointer to [spectrum\(\)](#) consecutive values, defining the color values.

*opacity* Drawing opacity (optional).

#### Note

- Clipping is supported.
- To set pixel values without clipping needs, you should use the faster [CImg::operator>\(\)](#) function.

#### Example:

```
CImg<unsigned char> img(100,100,1,3,0);
const unsigned char color[] = { 255,128,64 };
img.draw_point(50,50,color);
```

#### 8.1.4.71 CImg<T>& draw\_line ( const int *x0*, const int *y0*, const int *x1*, const int *y1*, const tc \*const *color*, const float *opacity* = 1, const unsigned int *pattern* = ~0U, const bool *init\_hatch* = true )

Draw a 2d colored line.

#### Parameters

*x0* X-coordinate of the starting line point.

*y0* Y-coordinate of the starting line point.

*x1* X-coordinate of the ending line point.

*y1* Y-coordinate of the ending line point.

*color* Pointer to [spectrum\(\)](#) consecutive values of type T, defining the drawing color.

*opacity* Drawing opacity (optional).

*pattern* An integer whose bits describe the line pattern (optional).

*init\_hatch* Flag telling if a reinitialization of the hash state must be done (optional).

#### Note

- Clipping is supported.
- Line routine uses Bresenham's algorithm.
- Set *init\_hatch* = false to draw consecutive hatched segments without breaking the line pattern.

#### Example:

```
CImg<unsigned char> img(100,100,1,3,0);
const unsigned char color[] = { 255,128,64 };
img.draw_line(40,40,80,70,color);
```

#### 8.1.4.72 CImg<T>& draw\_line ( const int *x0*, const int *y0*, const int *x1*, const int *y1*, const CImg< tc > & *texture*, const int *tx0*, const int *ty0*, const int *tx1*, const int *ty1*, const float *opacity* = 1, const unsigned int *pattern* = ~0U, const bool *init\_hatch* = true )

Draw a 2d textured line.

**Parameters**

*x0* X-coordinate of the starting line point.  
*y0* Y-coordinate of the starting line point.  
*x1* X-coordinate of the ending line point.  
*y1* Y-coordinate of the ending line point.  
*texture* Texture image defining the pixel colors.  
*tx0* X-coordinate of the starting texture point.  
*ty0* Y-coordinate of the starting texture point.  
*tx1* X-coordinate of the ending texture point.  
*ty1* Y-coordinate of the ending texture point.  
*opacity* Drawing opacity (optional).  
*pattern* An integer whose bits describe the line pattern (optional).  
*init\_hatch* Flag telling if the hash variable must be reinitialized (optional).

**Note**

- Clipping is supported but not for texture coordinates.
- Line routine uses the well known Bresenham's algorithm.

**Example:**

```
CImg<unsigned char> img(100,100,1,3,0), texture("texture256x256.ppm");
const unsigned char color[] = { 255,128,64 };
img.draw_line(40,40,80,70,texture,0,0,255,255);
```

#### 8.1.4.73 CImg<T>& draw\_line ( const CImg< t > & points, const tc \*const color, const float opacity = 1, const unsigned int pattern = ~0U, const bool init\_hatch = true )

Draw a set of consecutive colored lines in the instance image.

**Parameters**

*points* Coordinates of vertices, stored as a list of vectors.  
*color* Pointer to [spectrum\(\)](#) consecutive values of type T, defining the drawing color.  
*opacity* Drawing opacity (optional).  
*pattern* An integer whose bits describe the line pattern (optional).  
*init\_hatch* If set to true, init hatch motif.

**Note**

- This function uses several call to the single [CImg::draw\\_line\(\)](#) procedure, depending on the vectors size in *points*.

**Example:**

```
CImg<unsigned char> img(100,100,1,3,0);
const unsigned char color[] = { 255,128,64 };
CImgList<int> points;
points.insert(CImg<int>::vector(0,0)).
    .insert(CImg<int>::vector(70,10)).
    .insert(CImg<int>::vector(80,60)).
    .insert(CImg<int>::vector(10,90));
img.draw_line(points,color);
```

**8.1.4.74** `CImg<T>& draw_arrow ( const int x0, const int y0, const int x1, const int y1, const tc *const color, const float opacity = 1, const float angle = 30, const float length = -10, const unsigned int pattern = ~0U )`

Draw a colored arrow in the instance image.

#### Parameters

- x0* X-coordinate of the starting arrow point (tail).
- y0* Y-coordinate of the starting arrow point (tail).
- x1* X-coordinate of the ending arrow point (head).
- y1* Y-coordinate of the ending arrow point (head).
- color* Pointer to `spectrum()` consecutive values of type T, defining the drawing color.
- angle* Aperture angle of the arrow head (optional).
- length* Length of the arrow head. If negative, describes a percentage of the arrow length (optional).
- opacity* Drawing opacity (optional).
- pattern* An integer whose bits describe the line pattern (optional).

#### Note

- Clipping is supported.

**8.1.4.75** `CImg<T>& draw_spline ( const int x0, const int y0, const float u0, const float v0, const int x1, const int y1, const float u1, const float v1, const tc *const color, const float opacity = 1, const float precision = 0.25, const unsigned int pattern = ~0U, const bool init_hatch = true )`

Draw a cubic spline curve in the instance image.

#### Parameters

- x0* X-coordinate of the starting curve point
- y0* Y-coordinate of the starting curve point
- u0* X-coordinate of the starting velocity
- v0* Y-coordinate of the starting velocity
- x1* X-coordinate of the ending curve point
- y1* Y-coordinate of the ending curve point
- u1* X-coordinate of the ending velocity
- v1* Y-coordinate of the ending velocity
- color* Pointer to `spectrum()` consecutive values of type T, defining the drawing color.
- precision* Curve drawing precision (optional).
- opacity* Drawing opacity (optional).
- pattern* An integer whose bits describe the line pattern (optional).
- init\_hatch* If `true`, init hatch motif.

#### Note

- The curve is a 2d cubic Bezier spline, from the set of specified starting/ending points and corresponding velocity vectors.

- The spline is drawn as a serie of connected segments. The `precision` parameter sets the average number of pixels in each drawn segment.
- A cubic Bezier curve is sometimes defined by a set of 4 points { (x0,y0), (xa,ya), (xb,yb), (x1,y1) } where (x0,y0) is the starting point, (x1,y1) is the ending point and (xa,ya), (xb,yb) are two *control* points. The starting and ending velocities (u0,v0) and (u1,v1) can be deduced easily from the control points as  $u0 = (xa - x0)$ ,  $v0 = (ya - y0)$ ,  $u1 = (x1 - xb)$  and  $v1 = (y1 - yb)$ .

**Example:**

```
CImg<unsigned char> img(100,100,1,3,0);
const unsigned char color[] = { 255,255,255 };
img.draw_spline(30,30,0,100,90,40,0,-100,color);
```

**8.1.4.76** `CImg<T>& draw_spline ( const int x0, const int y0, const int z0, const float u0, const float v0, const float w0, const int x1, const int y1, const int z1, const float u1, const float v1, const float w1, const tc *const color, const float opacity = 1, const float precision = 4, const unsigned int pattern = ~0U, const bool init_hatch = true )`

Draw a cubic spline curve in the instance image (for volumetric images).

**Note**

- Similar to [CImg::draw\\_spline\(\)](#) for a 3d spline in a volumetric image.

**8.1.4.77** `CImg<T>& draw_spline ( const int x0, const int y0, const float u0, const float v0, const int x1, const int y1, const float u1, const float v1, const CImg< t > & texture, const int tx0, const int ty0, const int tx1, const int ty1, const float opacity = 1, const float precision = 4, const unsigned int pattern = ~0U, const bool init_hatch = true )`

Draw a cubic spline curve in the instance image.

**Parameters**

**x0** X-coordinate of the starting curve point  
**y0** Y-coordinate of the starting curve point  
**u0** X-coordinate of the starting velocity  
**v0** Y-coordinate of the starting velocity  
**x1** X-coordinate of the ending curve point  
**y1** Y-coordinate of the ending curve point  
**u1** X-coordinate of the ending velocity  
**v1** Y-coordinate of the ending velocity  
**texture** Texture image defining line pixel colors.  
**tx0** X-coordinate of the starting texture point.  
**ty0** Y-coordinate of the starting texture point.  
**tx1** X-coordinate of the ending texture point.  
**ty1** Y-coordinate of the ending texture point.  
**precision** Curve drawing precision (optional).  
**opacity** Drawing opacity (optional).  
**pattern** An integer whose bits describe the line pattern (optional).  
**init\_hatch** if `true`, reinit hatch motif.

**8.1.4.78** `CImg<T>& draw_triangle ( const int x0, const int y0, const int x1, const int y1,  
const int x2, const int y2, const tc *const color, const float brightness0, const float  
brightness1, const float brightness2, const float opacity = 1 )`

Draw a 2d Gouraud-shaded colored triangle.

#### Parameters

*x0* = X-coordinate of the first corner in the instance image.  
*y0* = Y-coordinate of the first corner in the instance image.  
*x1* = X-coordinate of the second corner in the instance image.  
*y1* = Y-coordinate of the second corner in the instance image.  
*x2* = X-coordinate of the third corner in the instance image.  
*y2* = Y-coordinate of the third corner in the instance image.  
*color* = array of [spectrum\(\)](#) values of type T, defining the global drawing color.  
*brightness0* = brightness of the first corner (in [0,2]).  
*brightness1* = brightness of the second corner (in [0,2]).  
*brightness2* = brightness of the third corner (in [0,2]).  
*opacity* = opacity of the drawing.

#### Note

Clipping is supported.

**8.1.4.79** `CImg<T>& draw_triangle ( const int x0, const int y0, const int x1, const int y1,  
const int x2, const int y2, const CImg< tc > & texture, const int tx0, const int ty0,  
const int tx1, const int ty1, const int tx2, const int ty2, const float opacity = 1, const  
float brightness = 1 )`

Draw a 2d textured triangle.

#### Parameters

*x0* = X-coordinate of the first corner in the instance image.  
*y0* = Y-coordinate of the first corner in the instance image.  
*x1* = X-coordinate of the second corner in the instance image.  
*y1* = Y-coordinate of the second corner in the instance image.  
*x2* = X-coordinate of the third corner in the instance image.  
*y2* = Y-coordinate of the third corner in the instance image.  
*texture* = texture image used to fill the triangle.  
*tx0* = X-coordinate of the first corner in the texture image.  
*ty0* = Y-coordinate of the first corner in the texture image.  
*tx1* = X-coordinate of the second corner in the texture image.  
*ty1* = Y-coordinate of the second corner in the texture image.  
*tx2* = X-coordinate of the third corner in the texture image.  
*ty2* = Y-coordinate of the third corner in the texture image.

*opacity* = opacity of the drawing.

*brightness* = brightness of the drawing (in [0,2]).

#### Note

Clipping is supported, but texture coordinates do not support clipping.

**8.1.4.80** CImg<T>& draw\_triangle ( const int *x0*, const int *y0*, const int *x1*, const int *y1*, const int *x2*, const int *y2*, const tc \*const *color*, const CImg< tl > & *light*, const int *lx0*, const int *ly0*, const int *lx1*, const int *ly1*, const int *lx2*, const int *ly2*, const float *opacity* = 1 )

Draw a 2d Pseudo-Phong-shaded triangle.

#### Parameters

*x0* = X-coordinate of the first corner in the instance image.

*y0* = Y-coordinate of the first corner in the instance image.

*x1* = X-coordinate of the second corner in the instance image.

*y1* = Y-coordinate of the second corner in the instance image.

*x2* = X-coordinate of the third corner in the instance image.

*y2* = Y-coordinate of the third corner in the instance image.

*color* = array of [spectrum\(\)](#) values of type T, defining the global drawing color.

*light* = light image.

*lx0* = X-coordinate of the first corner in the light image.

*ly0* = Y-coordinate of the first corner in the light image.

*lx1* = X-coordinate of the second corner in the light image.

*ly1* = Y-coordinate of the second corner in the light image.

*lx2* = X-coordinate of the third corner in the light image.

*ly2* = Y-coordinate of the third corner in the light image.

*opacity* = opacity of the drawing.

#### Note

Clipping is supported, but texture coordinates do not support clipping.

**8.1.4.81** CImg<T>& draw\_triangle ( const int *x0*, const int *y0*, const int *x1*, const int *y1*, const int *x2*, const int *y2*, const CImg< tc > & *texture*, const int *tx0*, const int *ty0*, const int *tx1*, const int *ty1*, const int *tx2*, const int *ty2*, const float *brightness0*, const float *brightness1*, const float *brightness2*, const float *opacity* = 1 )

Draw a 2d Gouraud-shaded textured triangle.

#### Parameters

*x0* = X-coordinate of the first corner in the instance image.

*y0* = Y-coordinate of the first corner in the instance image.

*x1* = X-coordinate of the second corner in the instance image.

*y1* = Y-coordinate of the second corner in the instance image.

*x2* = X-coordinate of the third corner in the instance image.

*y2* = Y-coordinate of the third corner in the instance image.

*texture* = texture image used to fill the triangle.

*tx0* = X-coordinate of the first corner in the texture image.

*ty0* = Y-coordinate of the first corner in the texture image.

*tx1* = X-coordinate of the second corner in the texture image.

*ty1* = Y-coordinate of the second corner in the texture image.

*tx2* = X-coordinate of the third corner in the texture image.

*ty2* = Y-coordinate of the third corner in the texture image.

*brightness0* = brightness value of the first corner.

*brightness1* = brightness value of the second corner.

*brightness2* = brightness value of the third corner.

*opacity* = opacity of the drawing.

#### Note

Clipping is supported, but texture coordinates do not support clipping.

**8.1.4.82** `CImg<T>& draw_triangle ( const int x0, const int y0, const int x1, const int y1, const int x2, const int y2, const CImg< tc > & texture, const int tx0, const int ty0, const int tx1, const int ty1, const int tx2, const int ty2, const CImg< tl > & light, const int lx0, const int ly0, const int lx1, const int ly1, const int lx2, const int ly2, const float opacity = 1 )`

Draw a 2d Pseudo-Phong-shaded textured triangle.

#### Parameters

*x0* = X-coordinate of the first corner in the instance image.

*y0* = Y-coordinate of the first corner in the instance image.

*x1* = X-coordinate of the second corner in the instance image.

*y1* = Y-coordinate of the second corner in the instance image.

*x2* = X-coordinate of the third corner in the instance image.

*y2* = Y-coordinate of the third corner in the instance image.

*texture* = texture image used to fill the triangle.

*tx0* = X-coordinate of the first corner in the texture image.

*ty0* = Y-coordinate of the first corner in the texture image.

*tx1* = X-coordinate of the second corner in the texture image.

*ty1* = Y-coordinate of the second corner in the texture image.

*tx2* = X-coordinate of the third corner in the texture image.

*ty2* = Y-coordinate of the third corner in the texture image.

*light* = light image.

*lx0* = X-coordinate of the first corner in the light image.  
*ly0* = Y-coordinate of the first corner in the light image.  
*lx1* = X-coordinate of the second corner in the light image.  
*ly1* = Y-coordinate of the second corner in the light image.  
*lx2* = X-coordinate of the third corner in the light image.  
*ly2* = Y-coordinate of the third corner in the light image.  
*opacity* = opacity of the drawing.

**Note**

Clipping is supported, but texture coordinates do not support clipping.

**8.1.4.83 CImg<T>& draw\_rectangle ( const int *x0*, const int *y0*, const int *z0*, const int *c0*, const int *x1*, const int *y1*, const int *z1*, const int *c1*, const T *val*, const float *opacity* = 1 )**

Draw a 4d filled rectangle in the instance image, at coordinates (*x0*,*y0*,*z0*,*c0*)-(*x1*,*y1*,*z1*,*c1*).

**Parameters**

*x0* X-coordinate of the upper-left rectangle corner.  
*y0* Y-coordinate of the upper-left rectangle corner.  
*z0* Z-coordinate of the upper-left rectangle corner.  
*c0* C-coordinate of the upper-left rectangle corner.  
*x1* X-coordinate of the lower-right rectangle corner.  
*y1* Y-coordinate of the lower-right rectangle corner.  
*z1* Z-coordinate of the lower-right rectangle corner.  
*c1* C-coordinate of the lower-right rectangle corner.  
*val* Scalar value used to fill the rectangle area.  
*opacity* Drawing opacity (optional).

**Note**

- Clipping is supported.

**8.1.4.84 CImg<T>& draw\_rectangle ( const int *x0*, const int *y0*, const int *z0*, const int *x1*, const int *y1*, const int *z1*, const tc \*const *color*, const float *opacity* = 1 )**

Draw a 3d filled colored rectangle in the instance image, at coordinates (*x0*,*y0*,*z0*)-(*x1*,*y1*,*z1*).

**Parameters**

*x0* X-coordinate of the upper-left rectangle corner.  
*y0* Y-coordinate of the upper-left rectangle corner.  
*z0* Z-coordinate of the upper-left rectangle corner.  
*x1* X-coordinate of the lower-right rectangle corner.

*y1* Y-coordinate of the lower-right rectangle corner.

*z1* Z-coordinate of the lower-right rectangle corner.

*color* Pointer to [spectrum\(\)](#) consecutive values of type T, defining the drawing color.

*opacity* Drawing opacity (optional).

#### Note

- Clipping is supported.

#### 8.1.4.85 CImg<T>& draw\_rectangle ( const int x0, const int y0, const int x1, const int y1, const tc \*const color, const float opacity = 1 )

Draw a 2d filled colored rectangle in the instance image, at coordinates (x0,y0)-(x1,y1).

#### Parameters

*x0* X-coordinate of the upper-left rectangle corner.

*y0* Y-coordinate of the upper-left rectangle corner.

*x1* X-coordinate of the lower-right rectangle corner.

*y1* Y-coordinate of the lower-right rectangle corner.

*color* Pointer to [spectrum\(\)](#) consecutive values of type T, defining the drawing color.

*opacity* Drawing opacity (optional).

#### Note

- Clipping is supported.

#### 8.1.4.86 CImg<T>& draw\_circle ( const int x0, const int y0, int radius, const tc \*const color, const float opacity = 1 )

Draw a filled circle.

#### Parameters

*x0* X-coordinate of the circle center.

*y0* Y-coordinate of the circle center.

*radius* Circle radius.

*color* Array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* Drawing opacity.

#### Note

- Circle version of the Bresenham's algorithm is used.

#### 8.1.4.87 CImg<T>& draw\_circle ( const int *x0*, const int *y0*, int *radius*, const tc \*const *color*, const float *opacity*, const unsigned int )

Draw an outlined circle.

##### Parameters

*x0* X-coordinate of the circle center.

*y0* Y-coordinate of the circle center.

*radius* Circle radius.

*color* Array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* Drawing opacity.

#### 8.1.4.88 CImg<T>& draw\_ellipse ( const int *x0*, const int *y0*, const float *r1*, const float *r2*, const float *angle*, const tc \*const *color*, const float *opacity* = 1 )

Draw a filled ellipse.

##### Parameters

*x0* = X-coordinate of the ellipse center.

*y0* = Y-coordinate of the ellipse center.

*r1* = First radius of the ellipse.

*r2* = Second radius of the ellipse.

*angle* = Angle of the first radius.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

#### 8.1.4.89 CImg<T>& draw\_ellipse ( const int *x0*, const int *y0*, const CImg< t > & *tensor*, const tc \*const *color*, const float *opacity* = 1 )

Draw a filled ellipse.

##### Parameters

*x0* = X-coordinate of the ellipse center.

*y0* = Y-coordinate of the ellipse center.

*tensor* = Diffusion tensor describing the ellipse.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

#### 8.1.4.90 CImg<T>& draw\_ellipse ( const int *x0*, const int *y0*, const float *r1*, const float *r2*, const float *angle*, const tc \*const *color*, const float *opacity*, const unsigned int *pattern* )

Draw an outlined ellipse.

##### Parameters

- x0* = X-coordinate of the ellipse center.
- y0* = Y-coordinate of the ellipse center.
- r1* = First radius of the ellipse.
- r2* = Second radius of the ellipse.
- ru* = X-coordinate of the orientation vector related to the first radius.
- rv* = Y-coordinate of the orientation vector related to the first radius.
- color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.
- pattern* = If zero, the ellipse is filled, else pattern is an integer whose bits describe the outline pattern.
- opacity* = opacity of the drawing.

#### 8.1.4.91 CImg<T>& draw\_ellipse ( const int *x0*, const int *y0*, const CImg< t > & *tensor*, const tc \*const *color*, const float *opacity*, const unsigned int *pattern* )

Draw an outlined ellipse.

##### Parameters

- x0* = X-coordinate of the ellipse center.
- y0* = Y-coordinate of the ellipse center.
- tensor* = Diffusion tensor describing the ellipse.
- color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.
- opacity* = opacity of the drawing.

#### 8.1.4.92 CImg<T>& draw\_image ( const int *x0*, const int *y0*, const int *z0*, const int *c0*, const CImg< t > & *sprite*, const float *opacity* = 1 )

Draw an image.

##### Parameters

- sprite* Sprite image.
- x0* X-coordinate of the sprite position.
- y0* Y-coordinate of the sprite position.
- z0* Z-coordinate of the sprite position.
- c0* C-coordinate of the sprite position.
- opacity* Drawing opacity (optional).

##### Note

- Clipping is supported.

#### 8.1.4.93 CImg<T>& draw\_image ( const int *x0*, const int *y0*, const int *z0*, const int *c0*, const CImg< ti > & *sprite*, const CImg< tm > & *mask*, const float *opacity* = 1, const float *mask\_valmax* = 1 )

Draw a sprite image in the instance image (masked version).

##### Parameters

*sprite* Sprite image.

*mask* Mask image.

*x0* X-coordinate of the sprite position in the instance image.

*y0* Y-coordinate of the sprite position in the instance image.

*z0* Z-coordinate of the sprite position in the instance image.

*c0* C-coordinate of the sprite position in the instance image.

*mask\_valmax* Maximum pixel value of the mask image *mask* (optional).

*opacity* Drawing opacity.

##### Note

- Pixel values of *mask* set the opacity of the corresponding pixels in *sprite*.
- Clipping is supported.
- Dimensions along *x*, *y* and *z* of *sprite* and *mask* must be the same.

#### 8.1.4.94 CImg<T>& draw\_text ( const int *x0*, const int *y0*, const char \*const *text*, const tc1 \*const *foreground\_color*, const tc2 \*const *background\_color*, const float *opacity*, const CImgList< t > & *font*, ... )

Draw a text.

##### Parameters

*x0* X-coordinate of the text in the instance image.

*y0* Y-coordinate of the text in the instance image.

*foreground\_color* Array of [spectrum\(\)](#) values of type *T*, defining the foreground color (0 means 'transparent').

*background\_color* Array of [spectrum\(\)](#) values of type *T*, defining the background color (0 means 'transparent').

*font* Font used for drawing text.

*opacity* Drawing opacity.

*format* 'printf'-style format string, followed by arguments.

##### Note

Clipping is supported.

**8.1.4.95** `CImg<T>& draw_text ( const int x0, const int y0, const char *const text, const tc1 *const foreground_color, const tc2 *const background_color, const float opacity = 1, const unsigned int font_height = 13, ... )`

Draw a text.

#### Parameters

*x0* X-coordinate of the text in the instance image.

*y0* Y-coordinate of the text in the instance image.

*foreground\_color* Array of [spectrum\(\)](#) values of type T, defining the foreground color (0 means 'transparent').

*background\_color* Array of [spectrum\(\)](#) values of type T, defining the background color (0 means 'transparent').

*font\_size* Size of the font (exact match for 13,24,32,57).

*opacity* Drawing opacity.

*format* 'printf'-style format string, followed by arguments.

#### Note

Clipping is supported.

**8.1.4.96** `CImg<T>& draw_quiver ( const CImg< t1 > & flow, const t2 *const color, const float opacity = 1, const unsigned int sampling = 25, const float factor = -20, const bool arrows = true, const unsigned int pattern = ~0U )`

Draw a vector field in the instance image, using a colormap.

#### Parameters

*flow* Image of 2d vectors used as input data.

*color* Image of [spectrum\(\)](#)-D vectors corresponding to the color of each arrow.

*sampling* Length (in pixels) between each arrow.

*factor* Length factor of each arrow (if <0, computed as a percentage of the maximum length).

*opacity* Opacity of the drawing.

*pattern* Used pattern to draw lines.

#### Note

Clipping is supported.

**8.1.4.97** `CImg<T>& draw_quiver ( const CImg< t1 > & flow, const CImg< t2 > & color, const float opacity = 1, const unsigned int sampling = 25, const float factor = -20, const bool arrows = true, const unsigned int pattern = ~0U )`

Draw a vector field in the instance image, using a colormap.

#### Parameters

*flow* Image of 2d vectors used as input data.

*color* Image of [spectrum\(\)](#)-D vectors corresponding to the color of each arrow.  
*sampling* Length (in pixels) between each arrow.  
*factor* Length factor of each arrow (if <0, computed as a percentage of the maximum length).  
*opacity* Opacity of the drawing.  
*pattern* Used pattern to draw lines.

**Note**

Clipping is supported.

**8.1.4.98** `CImg<T>& draw_axis ( const CImg< t > & xvalues, const int y, const tc *const color, const float opacity = 1, const unsigned int pattern = ~0U )`

Draw a labeled horizontal axis on the instance image.

**Parameters**

*xvalues* Lower bound of the x-range.  
*y* Y-coordinate of the horizontal axis in the instance image.  
*color* Array of [spectrum\(\)](#) values of type T, defining the drawing color.  
*opacity* Drawing opacity.  
*pattern* Drawing pattern.  
*opacity\_out* Drawing opacity of 'outside' axes.

**Note**

if `precision==0`, precision of the labels is automatically computed.

**8.1.4.99** `CImg<T>& draw_graph ( const CImg< t > & data, const tc *const color, const float opacity = 1, const unsigned int plot_type = 1, const int vertex_type = 1, const double ymin = 0, const double ymax = 0, const unsigned int pattern = ~0U )`

Draw a 1d graph on the instance image.

**Parameters**

*data* Image containing the graph values  $I = f(x)$ .  
*color* Array of [spectrum\(\)](#) values of type T, defining the drawing color.  
*opacity* Drawing opacity.  
*plot\_type* Define the type of the plot :

- 0 = No plot.
- 1 = Plot using segments.
- 2 = Plot using cubic splines.
- 3 = Plot with bars.

*vertex\_type* Define the type of points :

- 0 = No points.
- 1 = Point.

- 2 = Straight cross.
- 3 = Diagonal cross.
- 4 = Filled circle.
- 5 = Outlined circle.
- 6 = Square.
- 7 = Diamond.

*ymin* Lower bound of the y-range.

*ymax* Upper bound of the y-range.

*pattern* Drawing pattern.

#### Note

- if `ymin==ymax==0`, the y-range is computed automatically from the input samples.

**8.1.4.100** `CImg<T>& draw_fill ( const int x, const int y, const int z, const tc *const color, const float opacity, CImg< t > & region, const float sigma = 0, const bool high_connexity = false )`

Draw a 3d filled region starting from a point (x,y,\ z) in the instance image.

#### Parameters

*x* X-coordinate of the starting point of the region to fill.

*y* Y-coordinate of the starting point of the region to fill.

*z* Z-coordinate of the starting point of the region to fill.

*color* An array of [spectrum\(\)](#) values of type T, defining the drawing color.

*region* Image that will contain the mask of the filled region mask, as an output.

*sigma* Tolerance concerning neighborhood values.

*opacity* Opacity of the drawing.

*high\_connexity* Tells if 8-connexity must be used (only for 2d images).

#### Returns

*region* is initialized with the binary mask of the filled region.

**8.1.4.101** `CImg<T>& draw_fill ( const int x, const int y, const int z, const tc *const color, const float opacity = 1, const float sigma = 0, const bool high_connexity = false )`

Draw a 3d filled region starting from a point (x,y,\ z) in the instance image.

#### Parameters

*x* = X-coordinate of the starting point of the region to fill.

*y* = Y-coordinate of the starting point of the region to fill.

*z* = Z-coordinate of the starting point of the region to fill.

*color* = an array of [spectrum\(\)](#) values of type T, defining the drawing color.

*sigma* = tolerance concerning neighborhood values.

*opacity* = opacity of the drawing.

#### 8.1.4.102 CImg<T>& draw\_fill ( const int x, const int y, const tc \*const color, const float opacity = 1, const float sigma = 0, const bool high\_connexity = false )

Draw a 2d filled region starting from a point (x,y) in the instance image.

##### Parameters

*x* = X-coordinate of the starting point of the region to fill.  
*y* = Y-coordinate of the starting point of the region to fill.  
*color* = an array of [spectrum\(\)](#) values of type T, defining the drawing color.  
*sigma* = tolerance concerning neighborhood values.  
*opacity* = opacity of the drawing.

#### 8.1.4.103 CImg<T>& draw\_plasma ( const int x0, const int y0, const int x1, const int y1, const float alpha = 1, const float beta = 1, const float opacity = 1 )

Draw a plasma random texture.

##### Parameters

*x0* = X-coordinate of the upper-left corner of the plasma.  
*y0* = Y-coordinate of the upper-left corner of the plasma.  
*x1* = X-coordinate of the lower-right corner of the plasma.  
*y1* = Y-coordinate of the lower-right corner of the plasma.  
*alpha* = Alpha-parameter of the plasma.  
*beta* = Beta-parameter of the plasma.  
*opacity* = opacity of the drawing.

#### 8.1.4.104 CImg<T>& draw\_plasma ( const float alpha = 1, const float beta = 1, const float opacity = 1 )

Draw a plasma random texture.

##### Parameters

*alpha* = Alpha-parameter of the plasma.  
*beta* = Beta-parameter of the plasma.  
*opacity* = opacity of the drawing.

#### 8.1.4.105 CImg<T>& draw\_gaussian ( const float xc, const float sigma, const tc \*const color, const float opacity = 1 )

Draw a 1d gaussian function in the instance image.

##### Parameters

*xc* = X-coordinate of the gaussian center.  
*sigma* = Standard variation of the gaussian distribution.  
*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.  
*opacity* = opacity of the drawing.

#### 8.1.4.106 CImg<T>& draw\_gaussian ( const float *xc*, const float *yc*, const CImg< t > & *tensor*, const tc \*const *color*, const float *opacity* = 1 )

Draw an anisotropic 2d gaussian function.

##### Parameters

*xc* = X-coordinate of the gaussian center.

*yc* = Y-coordinate of the gaussian center.

*tensor* = 2x2 covariance matrix.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

#### 8.1.4.107 CImg<T>& draw\_gaussian ( const float *xc*, const float *yc*, const float *sigma*, const tc \*const *color*, const float *opacity* = 1 )

Draw an isotropic 2d gaussian function.

##### Parameters

*xc* = X-coordinate of the gaussian center.

*yc* = Y-coordinate of the gaussian center.

*sigma* = standard variation of the gaussian distribution.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

#### 8.1.4.108 CImg<T>& draw\_gaussian ( const float *xc*, const float *yc*, const float *zc*, const CImg< t > & *tensor*, const tc \*const *color*, const float *opacity* = 1 )

Draw an anisotropic 3d gaussian function.

##### Parameters

*xc* = X-coordinate of the gaussian center.

*yc* = Y-coordinate of the gaussian center.

*zc* = Z-coordinate of the gaussian center.

*tensor* = 3x3 covariance matrix.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

#### 8.1.4.109 CImg<T>& draw\_gaussian ( const float *xc*, const float *yc*, const float *zc*, const float *sigma*, const tc \*const *color*, const float *opacity* = 1 )

Draw an isotropic 3d gaussian function.

##### Parameters

*xc* = X-coordinate of the gaussian center.

*yc* = Y-coordinate of the gaussian center.

*zc* = Z-coordinate of the gaussian center.

*sigma* = standard variation of the gaussian distribution.

*color* = array of [spectrum\(\)](#) values of type T, defining the drawing color.

*opacity* = opacity of the drawing.

**8.1.4.110** `CImg<T>& draw_object3d ( const float x0, const float y0, const float z0, const CImg<tp> & vertices, const CImgList<tf> & primitives, const CImgList<tc> & colors, const CImg<to> & opacities, const unsigned int render_type = 4, const bool double_sided = false, const float focale = 500, const float lightx = 0, const float lighty = 0, const float lightz = -5e8, const float specular_light = 0.2f, const float specular_shine = 0.1f )`

Draw a 3d object.

#### Parameters

*X* = X-coordinate of the 3d object position

*Y* = Y-coordinate of the 3d object position

*Z* = Z-coordinate of the 3d object position

*vertices* = Image Nx3 describing 3d point coordinates

*primitives* = List of P primitives

*colors* = List of P color (or textures)

*opacities* = Image or list of P opacities

*render\_type* = Render type (0=Points, 1=Lines, 2=Faces (no light), 3=Faces (flat), 4=Faces(Gouraud)

*double\_sided* = Tell if object faces have two sides or are oriented.

*focale* = length of the focale (0 for parallel projection)

*lightx* = X-coordinate of the light

*lighty* = Y-coordinate of the light

*lightz* = Z-coordinate of the light

*specular\_shine* = Shininess of the object

**8.1.4.111** `CImg<T>& select ( CImgDisplay & disp, const int select_type = 2, unsigned int *const XYZ = 0, const unsigned char *const color = 0 )`

Simple interface to select a shape from an image.

#### Parameters

*selection* Array of 6 values containing the selection result

*coords\_type* Determine shape type to select (0=point, 1=vector, 2=rectangle, 3=circle)

*disp* Display window used to make the selection

*XYZ* Initial XYZ position (for volumetric images only)

*color* Color of the shape selector.

**8.1.4.112 CImg<T>& load ( const char \*const *filename* )**

Load an image from a file.

**Parameters**

*filename* is the name of the image file to load.

**Note**

The extension of *filename* defines the file format. If no filename extension is provided, CImg<T>::get\_load() will try to load a .cimg file.

**8.1.4.113 CImg<T>& load\_tiff ( const char \*const *filename*, const unsigned int *first\_frame* = 0, const unsigned int *last\_frame* = ~0U, const unsigned int *step\_frame* = 1 )**

Load an image from a TIFF file.

- libtiff support is enabled by defining the precompilation directive `cimg_use_tif`.
- When libtiff is enabled, 2D and 3D (multipage) several channel per pixel are supported for `char`, `uchar`, `short`, `ushort`, `float` and `double` pixel type.
- If `cimg_use_tif` is not defined at compilation time the function uses CImg<T>&[load\\_other\(const char\\*\)](#).

**See also**

[CImg<T>& load\\_other\(const char\\*\)](#)  
[CImg<T>& save\\_tiff\(const char\\*, const unsigned int\)](#)

**8.1.4.114 const CImg<T>& print ( const char \*const *title* = 0, const bool *display\_stats* = *true* ) const**

Display informations about the image on the standard error output.

**Parameters**

*title* Name for the considered image (optional).

*display\_stats* Compute and display image statistics (optional).

**8.1.4.115 const CImg<T>& save ( const char \*const *filename*, const int *number* = -1 ) const**

Save the image as a file.

The used file format is defined by the file extension in the filename *filename*. Parameter *number* can be used to add a 6-digit number to the filename before saving.

**8.1.4.116** `const CImg<T>& save_tiff ( const char *const filename, const unsigned int compression = 0 ) const`

Save a file in TIFF format.

- libtiff support is enabled by defining the precompilation directive `cimg_use_tif`.
- When libtiff is enabled, 2D and 3D (multipage) several channel per pixel are supported for `char`, `uchar`, `short`, `ushort`, `float` and `double` pixel type.
- If `cimg_use_tif` is not defined at compilation time the function uses `CImg<T>&save_other(const char*)`.

**Parameters**

*compression* 1:None, 2:CCITTRLE, 3:CCITTFAX3, 4:CCITTFAX4, 5:LZW, 6:JPEG

**See also**

[CImg<T>& save\\_other\(const char\\*\)](#)  
[CImg<T>& load\\_tiff\(const char\\*\)](#)

**8.1.4.117** `const CImg<T>& save_graphicsmagick_external ( const char *const filename, const unsigned int quality = 100 ) const`

Save the image using GraphicsMagick's `gm`.

Function that saves the image for other file formats that are not natively handled by [CImg](#), using the tool 'gm' from the GraphicsMagick package.

This is the case for all compressed image formats (GIF,PNG,JPG,TIF, ...). You need to install the GraphicsMagick package in order to get this function working properly (see <http://www.graphicsmagick.org>).

**8.1.4.118** `const CImg<T>& save_imagemagick_external ( const char *const filename, const unsigned int quality = 100 ) const`

Save the image using ImageMagick's `convert`.

Function that saves the image for other file formats that are not natively handled by [CImg](#), using the tool 'convert' from the ImageMagick package.

This is the case for all compressed image formats (GIF,PNG,JPG,TIF, ...). You need to install the ImageMagick package in order to get this function working properly (see <http://www.imagemagick.org>).

## 8.2 CImgDisplay Struct Reference

This class represents a window which can display [CImg](#) images and handles mouse and keyboard events.

## Constructors / Destructor / Instance Management

- [~CImgDisplay \(\)](#)  
*Destructor.*

*Test if a key sequence has been typed.*

## Instance Characteristics

- int **width** () const  
*Return display width.*
- int **height** () const  
*Return display height.*
- int **mouse\_x** () const  
*Return X-coordinate of the mouse pointer.*
- int **mouse\_y** () const  
*Return Y-coordinate of the mouse pointer.*
- unsigned int **button** () const  
*Return current or previous state of the mouse buttons.*
- int **wheel** () const  
*Return current state of the mouse wheel.*
- unsigned int **key** (const unsigned int pos=0) const  
*Return current or previous state of the keyboard.*
- unsigned int **released\_key** (const unsigned int pos=0) const
- unsigned int **normalization** () const  
*Return normalization type of the display.*
- const char \* **title** () const

*Return title of the display.*

- int [window\\_width](#) () const  
*Return display window width.*
- int [window\\_height](#) () const  
*Return display window height.*
- int [window\\_x](#) () const  
*Return X-coordinate of the window.*
- int [window\\_y](#) () const  
*Return Y-coordinate of the window.*
- float [frames\\_per\\_second](#) ()  
*Return the frame per second rate.*
- static unsigned int [keycode](#) (const char \*const textcode)  
*Get keycode corresponding to given input string.*
- static int [screen\\_width](#) ()  
*Return the width of the screen resolution.*
- static int [screen\\_height](#) ()  
*Return the height of the screen resolution.*

## Display Manipulation

- template<typename T >  
[CImgDisplay](#) & [display](#) (const [CImg](#)< T > &img)  
*Display an image in a window.*
- template<typename T >  
[CImgDisplay](#) & [display](#) (const [CImgList](#)< T > &list, const char axis='x', const char align='p')  
*Display an image list CImgList<T> into a display window.*
- [CImgDisplay](#) & [resize](#) (const bool redraw=true)  
*Resize a display window in its current size.*
- template<typename T >  
[CImgDisplay](#) & [resize](#) (const [CImg](#)< T > &img, const bool redraw=true)  
*Resize a display window with the size of an image.*
- [CImgDisplay](#) & [resize](#) (const [CImgDisplay](#) &disp, const bool redraw=true)  
*Resize a display window using the size of the given display disp.*
- [CImgDisplay](#) & [resize](#) (const int width, const int height, const bool redraw=true)  
*Resize window.*

- [CImgDisplay & set\\_fullscreen](#) (const bool is\_fullscreen, const bool redraw=true)  
*Set fullscreen mode.*
- [CImgDisplay & toggle\\_fullscreen](#) (const bool redraw=true)  
*Toggle fullscreen mode.*
- [CImgDisplay & show](#) ()  
*Show a closed display.*
- [CImgDisplay & close](#) ()  
*Close a visible display.*
- [CImgDisplay & move](#) (const int pos\_x, const int pos\_y)  
*Move window.*
- [CImgDisplay & show\\_mouse](#) ()  
*Show mouse pointer.*
- [CImgDisplay & hide\\_mouse](#) ()  
*Hide mouse pointer.*
- [CImgDisplay & set\\_mouse](#) (const int pos\_x, const int pos\_y)  
*Move mouse pointer to a specific location.*
- [CImgDisplay & set\\_title](#) (const char \*const format,...)  
*Set the window title.*
- [template<typename T > CImgDisplay & render](#) (const [CImg](#)< T > &img)  
*Render image buffer into GDI native image format.*
- [CImgDisplay & paint](#) ()  
*Re-paint image content in window.*
- [template<typename T > const CImgDisplay & snapshot](#) ([CImg](#)< T > &img) const  
*Take a snapshot of the display in the specified image.*
- [CImgDisplay & set\\_button](#) ()  
*Simulate a mouse button event.*
- [CImgDisplay & set\\_button](#) (const unsigned int button, const bool is\_pressed=true)
- [CImgDisplay & set\\_wheel](#) ()  
*Simulate a mouse wheel event, or flush wheel events.*
- [CImgDisplay & set\\_wheel](#) (const int amplitude)
- [CImgDisplay & set\\_key](#) ()  
*Simulate a keyboard press/release event, or flush all key events.*
- [CImgDisplay & set\\_key](#) (const unsigned int keycode, const bool pressed=true)

- [CImgDisplay & flush \(\)](#)  
*Flush all display events.*
- [CImgDisplay & wait \(const unsigned int milliseconds\)](#)  
*Synchronized waiting function. Same as [cimg::wait\(\)](#).*
- [CImgDisplay & wait \(\)](#)  
*Wait for an event occuring on the current display.*
- static void [wait \(CImgDisplay &disp1\)](#)  
*Wait for any event occuring on the display *disp1*.*
- static void [wait \(CImgDisplay &disp1, CImgDisplay &disp2\)](#)  
*Wait for any event occuring either on the display *disp1* or *disp2*.*

- static void [wait \(CImgDisplay &disp1, CImgDisplay &disp2, CImgDisplay &disp3, CImgDisplay &disp4, CImgDisplay &disp5, CImgDisplay &disp6, CImgDisplay &disp7, CImgDisplay &disp8, CImgDisplay &disp9\)](#)  
*Wait for any event occuring either on the display *disp1*, *disp2*, *disp3*, *disp4*, ... *disp9*.*
- static void [wait \(CImgDisplay &disp1, CImgDisplay &disp2, CImgDisplay &disp3, CImgDisplay &disp4, CImgDisplay &disp5, CImgDisplay &disp6, CImgDisplay &disp7, CImgDisplay &disp8, CImgDisplay &disp9, CImgDisplay &disp10\)](#)  
*Wait for any event occuring either on the display *disp1*, *disp2*, *disp3*, *disp4*, ... *disp10*.*
- static void [wait\\_all \(\)](#)  
*Wait for a window event in any [CImg](#) window.*

### 8.2.1 Detailed Description

This class represents a window which can display [CImg](#) images and handles mouse and keyboard events. Creating a [CImgDisplay](#) instance opens a window that can be used to display a [CImg<T>](#) image of a [CImgList<T>](#) image list inside. When a display is created, associated window events (such as mouse motion, keyboard and window size changes) are handled and can be easily detected by testing specific [CImgDisplay](#) data fields. See [Using Display Windows](#). for a complete tutorial on using the [CImgDisplay](#) class.

### 8.2.2 Constructor & Destructor Documentation

#### 8.2.2.1 [CImgDisplay](#) ( *const unsigned int width*, *const unsigned int height*, *const char \*const title = 0*, *const unsigned int normalization = 3*, *const bool is\_fullscreen = false*, *const bool is\_closed = false* )

Create a display window with a specified size *pwidth* x *height*.

##### Parameters

*width* Width of the display window.

*height* Height of the display window.

*title* Title of the display window.

*normalization* Normalization type of the display window (0=none, 1=always, 2=once).

*is\_fullscreen* : Fullscreen mode.

*is\_closed* : Initially visible mode. A black image will be initially displayed in the display window.

#### 8.2.2.2 [CImgDisplay](#) ( *const CImg< T > & img*, *const char \*const title = 0*, *const unsigned int normalization = 3*, *const bool is\_fullscreen = false*, *const bool is\_closed = false* ) **[explicit]**

Create a display window from an image.

##### Parameters

*img* : Image that will be used to create the display window.

*title* : Title of the display window

*normalization* : Normalization type of the display window.

*is\_fullscreen* : Fullscreen mode.

*is\_closed* : Initially visible mode.

#### 8.2.2.3 [CImgDisplay](#) ( *const CImgList< T > & list*, *const char \*const title = 0*, *const unsigned int normalization = 3*, *const bool is\_fullscreen = false*, *const bool is\_closed = false* ) **[explicit]**

Create a display window from an image list.

##### Parameters

*list* : The list of images to display.

*title* : Title of the display window  
*normalization* : Normalization type of the display window.  
*is\_fullscreen* : Fullscreen mode.  
*is\_closed* : Initially visible mode.

#### 8.2.2.4 CImgDisplay ( const CImgDisplay & disp )

Create a display window by copying another one.

##### Parameters

*disp* : Display window to copy.

### 8.2.3 Member Function Documentation

#### 8.2.3.1 CImgDisplay& display ( const CImgList< T > & list, const char axis = 'x', const char align = 'p' )

Display an image list CImgList<T> into a display window.

First, all images of the list are appended into a single image used for visualization, then this image is displayed in the current display window.

##### Parameters

*list* : The list of images to display.  
*axis* : The axis used to append the image for visualization. Can be 'x' (default), 'y', 'z' or 'c'.  
*align* : Defines the relative alignment of images when displaying images of different sizes. Can be 'c' (centered, which is the default), 'p' (top alignment) and 'n' (bottom alignment).

#### 8.2.3.2 CImgDisplay& resize ( const CImg< T > & img, const bool redraw = true )

Resize a display window with the size of an image.

##### Parameters

*img* : Input image. `image.width` and `image.height` give the new dimensions of the display window.  
*redraw* : If `true` (default), the current displayed image in the display window will be block-interpolated to fit the new dimensions. If `false`, a black image will be drawn in the resized window.

## 8.3 CImgException Struct Reference

Instances of this class are thrown when errors occur during a CImg library function call.

Inherited by CImgArgumentException, CImgInstanceException, CImgIOException, and CImgWarningException.

### 8.3.1 Detailed Description

Instances of this class are thrown when errors occur during a CImg library function call.

### 8.3.2 Overview

[CImgException](#) is the base class of CImg exceptions. Exceptions are thrown by the CImg Library when an error occurred in a CImg library function call. [CImgException](#) is seldom thrown itself. Children classes that specify the kind of error encountered are generally used instead. These sub-classes are :

- **CImgInstanceException** : Thrown when the instance associated to the called CImg function is not correctly defined. Generally, this exception is thrown when one tries to process *empty* images. The example below will throw a *CImgInstanceException*.

```
CImg<float> img;           // Construct an empty image.
img.blur(10);             // Try to blur the image.
```

- **CImgArgumentException** : Thrown when one of the arguments given to the called CImg function is not correct. Generally, this exception is thrown when arguments passed to the function are outside an admissible range of values. The example below will throw a *CImgArgumentException*.

```
CImg<float> img(100,100,1,3); // Define a 100x100 color image with float
pixels.
img = 0;                     // Try to fill pixels from the 0 pointer (inva
lid argument to operator=() ).
```

- **CImgIOException** : Thrown when an error occurred when trying to load or save image files. The example below will throw a *CImgIOException*.

```
CImg<float> img("file_doesnt_exist.jpg"); // Try to load a file that doe
sn't exist.
```

The parent class [CImgException](#) may be thrown itself when errors that cannot be classified in one of the above type occur. It is recommended not to throw CImgExceptions yourself, since there are normally reserved to CImg Library functions. **CImgInstanceException**, **CImgArgumentException** and **CImgIOException** are simple subclasses of [CImgException](#) and are thus not detailed more in this reference documentation.

### 8.3.3 Exception handling

When an error occurs, the CImg Library first displays the error in a modal window. Then, it throws an instance of the corresponding exception class, generally leading the program to stop (this is the default behavior). You can bypass this default behavior by handling the exceptions yourself, using a code block `try { ... } catch () { ... }`. In this case, you can avoid the apparition of the modal window, by defining the environment variable `cimg_verbosity` to 0 before including the CImg header file. The example below shows how to cleanly handle CImg Library exceptions :

```
#define cimg_verbosity 0      // Disable modal window in CImg exceptions.
#define "CImg.h"
int main() {
    try {
        ...; // Here, do what you want.
    }
    catch (CImgInstanceException &e) {
        std::fprintf(stderr, "CImg Library Error : %s", e.what()); // Display yo
ur own error message
        ...                                                         // Do what yo
u want now.
    }
}
```

## 8.4 CImgList< T > Struct Template Reference

Class representing list of images CImg<T>.

### Public Types

- typedef CImg< T > \* iterator  
*Define a CImgList<T>::iterator.*
- typedef const CImg< T > \* const\_iterator  
*Define a CImgList<T>::const\_iterator.*
- typedef T value\_type  
*Value type.*

### Constructors / Destructor / Instance Management

- ~CImgList ()  
*Destructor.*
- CImgList ()  
*Default constructor.*
- CImgList (const unsigned int n)  
*Construct an image list containing n empty images.*
- CImgList (const unsigned int n, const unsigned int width, const unsigned int height=1, const unsigned int depth=1, const unsigned int spectrum=1)  
*Construct an image list containing n images with specified size.*
- CImgList (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const T val)  
*Construct an image list containing n images with specified size, filled with specified value.*
- CImgList (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const int val0, const int val1,...)  
*Construct an image list containing n images with specified size and specified pixel values (int version).*
- CImgList (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const double val0, const double val1,...)  
*Construct an image list containing n images with specified size and specified pixel values (double version).*
- template<typename t >  
CImgList (const unsigned int n, const CImg< t > &img, const bool shared=false)  
*Construct a list containing n copies of the image img.*
- template<typename t >  
CImgList (const CImg< t > &img, const bool shared=false)

*Construct an image list from one image.*

- `template<typename t1 , typename t2 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const bool shared=false)`

*Construct an image list from two images.*

- `template<typename t1 , typename t2 , typename t3 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const bool shared=false)`

*Construct an image list from three images.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const CImg< t4 > &img4, const bool shared=false)`

*Construct an image list from four images.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const bool shared=false)`

*Construct an image list from five images.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const bool shared=false)`

*Construct an image list from six images.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 , typename t7 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const CImg< t7 > &img7, const bool shared=false)`

*Construct an image list from seven images.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 , typename t7 , typename t8 >`  
`CImgList (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 > &img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const CImg< t7 > &img7, const CImg< t8 > &img8, const bool shared=false)`

*Construct an image list from eight images.*

- `template<typename t >`  
`CImgList (const CImgList< t > &list)`

*Default copy constructor.*

- `CImgList (const CImgList< T > &list)`
- `template<typename t >`  
`CImgList (const CImgList< t > &list, const bool shared)`

*Advanced copy constructor.*

- `CImgList (const char *const filename)`  
*Construct an image list from a filename.*

- `CImgList (const CImgDisplay &disp)`  
*Construct an image list from a display.*
- `CImgList< T > get_shared ()`  
*Return a shared instance of the list.*
- `const CImgList< T > get_shared () const`  
*Return a shared instance of the list.*
- `CImgList< T > & clear ()`  
*In-place version of the default constructor.*
- `CImgList< T > & assign ()`  
*In-place version of the default constructor and default destructor.*
- `CImgList< T > & assign (const unsigned int n)`  
*In-place version of the corresponding constructor.*
- `CImgList< T > & assign (const unsigned int n, const unsigned int width, const unsigned int height=1, const unsigned int depth=1, const unsigned int spectrum=1)`  
*In-place version of the corresponding constructor.*
- `CImgList< T > & assign (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const T val)`  
*In-place version of the corresponding constructor.*
- `CImgList< T > & assign (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const int val0, const int val1,...)`  
*In-place version of the corresponding constructor.*
- `CImgList< T > & assign (const unsigned int n, const unsigned int width, const unsigned int height, const unsigned int depth, const unsigned int spectrum, const double val0, const double val1,...)`  
*In-place version of the corresponding constructor.*
- `CImgList< T > & assign (const CImgList< T > &list, const bool shared=false)`  
*In-place version of the copy constructor.*
- `template<typename t >`  
`CImgList< T > & assign (const CImgList< t > &list, const bool shared=false)`
- `template<typename t >`  
`CImgList< T > & assign (const unsigned int n, const CImg< t > &img, const bool shared=false)`  
*In-place version of the corresponding constructor.*
- `template<typename t >`  
`CImgList< T > & assign (const CImg< t > &img, const bool shared=false)`  
*In-place version of the corresponding constructor.*
- `template<typename t1 , typename t2 >`  
`CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const CImg< t4 > &img4, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const  
bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 , typename t7 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const  
CImg< t7 > &img7, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `template<typename t1 , typename t2 , typename t3 , typename t4 , typename t5 , typename t6 , typename t7 , typename t8 >  
CImgList< T > & assign (const CImg< t1 > &img1, const CImg< t2 > &img2, const CImg< t3 >  
&img3, const CImg< t4 > &img4, const CImg< t5 > &img5, const CImg< t6 > &img6, const  
CImg< t7 > &img7, const CImg< t8 > &img8, const bool shared=false)`

*In-place version of the corresponding constructor.*

- `CImgList< T > & assign (const char *const filename)`

*In-place version of the corresponding constructor.*

- `CImgList< T > & assign (const CImgDisplay &disp)`

*In-place version of the corresponding constructor.*

- `template<typename t >  
CImgList< t > & move_to (CImgList< t > &list)`

*Move the content of the instance image list into another one.*

- `template<typename t >  
CImgList< t > & move_to (CImgList< t > &list, const unsigned int pos)`
- `CImgList< T > & swap (CImgList< T > &list)`

*Swap all fields of two CImgList instances (use with care !).*

- `static CImgList< T > & empty ()`

*Return a reference to an empty list.*

## Overloaded Operators

- `CImg< T > & operator()` (const unsigned int pos)  
*Return a reference to the i-th element of the image list.*
- `const CImg< T > & operator()` (const unsigned int pos) const
- `T & operator()` (const unsigned int pos, const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0)  
*Return a reference to (x,y,z,c) pixel of the pos-th image of the list.*
- `const T & operator()` (const unsigned int pos, const unsigned int x, const unsigned int y=0, const unsigned int z=0, const unsigned int c=0) const
- `operator const CImg< T > * ()` const  
*Return address of the image vector.*
- `operator CImg< T > * ()`
- `template<typename t >`  
`CImgList< T > & operator=` (const `CImg< t > &img`)

## Instance Characteristics

- `int width () const`  
*Return the size of the list.*
- `unsigned int size () const`  
*Return the size of the list.*
- `CImg< T > * data ()`  
*Return a pointer to the image buffer.*
- `const CImg< T > * data () const`
- `CImg< T > * data (const unsigned int l)`  
*Return a pointer to the image buffer.*
- `const CImg< T > * data (const unsigned int l) const`
- `iterator begin ()`  
*Returns an iterator to the beginning of the vector (STL-compliant name).*
- `const_iterator begin () const`
- `iterator end ()`  
*Returns an iterator just past the last element (STL-compliant name).*
- `const_iterator end () const`
- `CImg< T > & front ()`  
*Returns a reference to the first element (STL-compliant name).*
- `const CImg< T > & front () const`
- `const CImg< T > & back () const`  
*Return a reference to the last image (STL-compliant name).*
- `CImg< T > & back ()`
- `CImg< T > & at (const int pos)`  
*Read an image in specified position.*
- `T & atNXYZC (const int pos, const int x, const int y, const int z, const int c, const T out_val)`  
*Read a pixel value with Dirichlet boundary conditions.*
- `T atNXYZC (const int pos, const int x, const int y, const int z, const int c, const T out_val) const`
- `T & atNXYZC (const int pos, const int x, const int y, const int z, const int c)`  
*Read a pixel value with Neumann boundary conditions.*
- `T atNXYZC (const int pos, const int x, const int y, const int z, const int c) const`
- `T & atNXYZ (const int pos, const int x, const int y, const int z, const int c, const T out_val)`  
*Read a pixel value with Dirichlet boundary conditions for the four first coordinates (pos, x,y,z).*
- `T atNXYZ (const int pos, const int x, const int y, const int z, const int c, const T out_val) const`
- `T & atNXYZ (const int pos, const int x, const int y, const int z, const int c=0)`  
*Read a pixel value with Neumann boundary conditions for the four first coordinates (pos, x,y,z).*

- **T atNXYZ** (const int pos, const int x, const int y, const int z, const int c=0) const
- **T & atNXY** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const  
*Read a pixel value with Dirichlet boundary conditions for the three first coordinates (pos, x, y).*
- **T atNXY** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const
- **T & atNXY** (const int pos, const int x, const int y, const int z=0, const int c=0) const  
*Read a pixel value with Neumann boundary conditions for the three first coordinates (pos, x, y).*
- **T atNXY** (const int pos, const int x, const int y, const int z=0, const int c=0) const
- **T & atNX** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const  
*Read a pixel value with Dirichlet boundary conditions for the two first coordinates (pos, x).*
- **T atNX** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const
- **T & atNX** (const int pos, const int x, const int y=0, const int z=0, const int c=0) const  
*Read a pixel value with Neumann boundary conditions for the two first coordinates (pos, x).*
- **T atNX** (const int pos, const int x, const int y=0, const int z=0, const int c=0) const
- **T & atN** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const  
*Read a pixel value with Dirichlet boundary conditions for the first coordinates (pos).*
- **T atN** (const int pos, const int x, const int y, const int z, const int c, const T out\_val) const
- **T & atN** (const int pos, const int x=0, const int y=0, const int z=0, const int c=0) const  
*Read a pixel value with Neumann boundary conditions for the first coordinates (pos).*
- **T atN** (const int pos, const int x=0, const int y=0, const int z=0, const int c=0) const
- **CImg< charT > value\_string** (const char separator=',', const unsigned int max\_size=0) const  
*Return a C-string containing the values of all images in the instance list.*
- static const char \* **pixel\_type** ()  
*Return a string describing the type of the image pixels in the list (template parameter T).*

## Instance Checking

- bool **is\_empty** () const  
*Return true if list is empty.*
- bool **is\_sameN** (const unsigned int n) const  
*Return true if list if of specified size.*

*Return true if one of the image list contains the specified referenced value.*
- `template<typename t >`  
`bool contains (const CImg< T > &img, t &n) const`  
*Return true if the list contains the image 'img'. If true, returns the position (n) of the image in the list.*
- `bool contains (const CImg< T > &img) const`  
*Return true if the list contains the image img.*

## Mathematical Functions

- `T & min ()`  
*Return a reference to the minimum pixel value of the instance list.*
- `const T & min () const`
- `T & max ()`  
*Return a reference to the maximum pixel value of the instance list.*
- `const T & max () const`
- `template<typename t >`  
`T & min_max (t &max_val)`  
*Return a reference to the minimum pixel value of the instance list.*

- `template<typename t >`  
`const T & min_max (t &max_val) const`
- `template<typename t >`  
`T & max_min (t &min_val)`  
*Return a reference to the minimum pixel value of the instance list.*
- `template<typename t >`  
`const T & max_min (t &min_val) const`

## List Manipulation

- `template<typename t >`  
`CImgList< T > & insert (const CImg< t > &img, const unsigned int pos=~0U, const bool shared=false)`  
*Insert a copy of the image `img` into the current image list, at position `pos`.*
- `CImgList< T > & insert (const CImg< T > &img, const unsigned int pos=~0U, const bool shared=false)`
- `template<typename t >`  
`CImgList< T > get_insert (const CImg< t > &img, const unsigned int pos=~0U, const bool shared=false) const`
- `CImgList< T > & insert (const unsigned int n, const unsigned int pos=~0U)`  
*Insert `n` empty images `img` into the current image list, at position `pos`.*
- `CImgList< T > get_insert (const unsigned int n, const unsigned int pos=~0U) const`
- `template<typename t >`  
`CImgList< T > & insert (const unsigned int n, const CImg< t > &img, const unsigned int pos=~0U, const bool shared=false)`  
*Insert `n` copies of the image `img` into the current image list, at position `pos`.*
- `template<typename t >`  
`CImgList< T > get_insert (const unsigned int n, const CImg< t > &img, const unsigned int pos=~0U, const bool shared=false) const`
- `template<typename t >`  
`CImgList< T > & insert (const CImgList< t > &list, const unsigned int pos=~0U, const bool shared=false)`  
*Insert a copy of the image list `list` into the current image list, starting from position `pos`.*
- `template<typename t >`  
`CImgList< T > get_insert (const CImgList< t > &list, const unsigned int pos=~0U, const bool shared=false) const`
- `template<typename t >`  
`CImgList< T > & insert (const unsigned int n, const CImgList< t > &list, const unsigned int pos=~0U, const bool shared=false)`  
*Insert `n` copies of the list `list` at position `pos` of the current list.*
- `template<typename t >`  
`CImgList< T > get_insert (const unsigned int n, const CImgList< t > &list, const unsigned int pos=~0U, const bool shared=false) const`
- `CImgList< T > & remove (const unsigned int pos1, const unsigned int pos2)`

*Remove the images from positions `pos1` to `pos2`.*

- `CImgList< T > get_remove` (const unsigned int pos1, const unsigned int pos2) const
- `CImgList< T > & remove` (const unsigned int pos)

*Remove the image at position `pos` from the image list.*

- `CImgList< T > get_remove` (const unsigned int pos) const
- `CImgList< T > & remove` ()

*Remove the last image from the image list.*

- `CImgList< T > get_remove` () const
- `CImgList< T > & reverse` ()

*Reverse list order.*

- `CImgList< T > get_reverse` () const
- `CImgList< T > & images` (const unsigned int i0, const unsigned int i1)

*Get a sub-list.*

- `CImgList< T > get_images` (const unsigned int i0, const unsigned int i1) const
- `CImgList< T > get_shared_images` (const unsigned int i0, const unsigned int i1)

*Get a shared sub-list.*

- const `CImgList< T > get_shared_images` (const unsigned int i0, const unsigned int i1) const
- `CImg< T > get_append` (const char axis, const char align='p') const

*Return a single image which is the concatenation of all images of the current `CImgList` instance.*

- `CImgList< T > & split` (const char axis, const int nb=0)

*Return a list where each image has been split along the specified axis.*

- `CImgList< T > get_split` (const char axis, const int nb=0) const
- template<typename t >  
`CImgList< T > & push_back` (const `CImg< t >` &img)

*Insert image `img` at the end of the list (STL-compliant name).*

- template<typename t >  
`CImgList< T > & push_front` (const `CImg< t >` &img)

*Insert image `img` at the front of the list (STL-compliant name).*

- template<typename t >  
`CImgList< T > & push_back` (const `CImgList< t >` &list)

*Insert list `list` at the end of the current list (STL-compliant name).*

- template<typename t >  
`CImgList< T > & push_front` (const `CImgList< t >` &list)

*Insert list `list` at the front of the current list (STL-compliant name).*

- `CImgList< T > & pop_back` ()

*Remove last element of the list (STL-compliant name).*

- `CImgList< T > & pop_front` ()

*Remove first element of the list (STL-compliant name).*

- `CImgList< T > & erase (const iterator iter)`  
*Remove the element pointed by iterator `iter` (STL-compliant name).*

## Data Input

- `CImgList< T > & load (const char *const filename)`  
*Load an image list from a file.*
- `CImgList< T > & load_cimg (const char *const filename)`  
*Load an image list from a .cimg file.*
- `CImgList< T > & load_cimg (std::FILE *const file)`  
*Load an image list from a .cimg file.*
- `CImgList< T > & load_cimg (const char *const filename, const unsigned int n0, const unsigned int n1, const unsigned int x0, const unsigned int y0, const unsigned int z0, const unsigned int c0, const unsigned int x1, const unsigned int y1, const unsigned int z1, const unsigned int c1)`  
*Load a sub-image list from a non compressed .cimg file.*
- `CImgList< T > & load_cimg (std::FILE *const file, const unsigned int n0, const unsigned int n1, const unsigned int x0, const unsigned int y0, const unsigned int z0, const unsigned int c0, const unsigned int x1, const unsigned int y1, const unsigned int z1, const unsigned int c1)`  
*Load a sub-image list from a non compressed .cimg file.*
- `CImgList< T > & load_parrec (const char *const filename)`  
*Load an image list from a PAR/REC (Philips) file.*
- `CImgList< T > & load_yuv (const char *const filename, const unsigned int size_x, const unsigned int size_y, const unsigned int first_frame=0, const unsigned int last_frame=~0U, const unsigned int step_frame=1, const bool yuv2rgb=true)`  
*Load an image sequence from a YUV file.*
- `CImgList< T > & load_yuv (std::FILE *const file, const unsigned int size_x, const unsigned int size_y, const unsigned int first_frame=0, const unsigned int last_frame=~0U, const unsigned int step_frame=1, const bool yuv2rgb=true)`

### 8.4.1 Detailed Description

`template<typename T> struct cimg_library::CImgList< T >`

Class representing list of images CImg<T>.

### 8.4.2 Member Function Documentation

#### 8.4.2.1 CImgList<T>& clear ( )

In-place version of the default constructor.

This function is strictly equivalent to [assign\(\)](#) and has been introduced for having a STL-compliant function name.

#### 8.4.2.2 CImgList<T> operator+ ( ) const

Operator+() (unary).

Writing '+list' is a convenient shortcut to 'CImgList<T>(list,false)' (forces a copy with non-shared elements).

#### 8.4.2.3 CImg<T> get\_append ( const char axis, const char align = 'p' ) const

Return a single image which is the concatenation of all images of the current [CImgList](#) instance.

#### Parameters

**axis** : specify the axis for image concatenation. Can be 'x','y','z' or 'c'.

*align* : specify the alignment for image concatenation. Can be 'p' (top), 'c' (center) or 'n' (bottom).

### Returns

A CImg<T> image corresponding to the concatenation is returned.

#### 8.4.2.4 `const CImgList<T>& display ( CImgDisplay & disp, const char axis = 'x', const char align = 'p' ) const`

Display the current CImgList instance in an existing CImgDisplay window (by reference).

This function displays the list images of the current CImgList instance into an existing CImgDisplay window. Images of the list are concatenated in a single temporarily image for visualization purposes. The function returns immediately.

### Parameters

*disp* : reference to an existing CImgDisplay instance, where the current image list will be displayed.

*axis* : specify the axis for image concatenation. Can be 'x','y','z' or 'c'.

*align* : specify the alignment for image concatenation. Can be 'p' (top), 'c' (center) or 'n' (bottom).

### Returns

A reference to the current CImgList instance is returned.

#### 8.4.2.5 `const CImgList<T>& display ( CImgDisplay & disp, const bool display_info, const char axis = 'x', const char align = 'p' ) const`

Display the current CImgList instance in a new display window.

This function opens a new window with a specific title and displays the list images of the current CImgList instance into it. Images of the list are concatenated in a single temporarily image for visualization purposes. The function returns when a key is pressed or the display window is closed by the user.

### Parameters

*title* : specify the title of the opening display window.

*axis* : specify the axis for image concatenation. Can be 'x','y','z' or 'c'.

*align* : specify the alignment for image concatenation. Can be 'p' (top), 'c' (center) or 'n' (bottom).

### Returns

A reference to the current CImgList instance is returned.

#### 8.4.2.6 `const CImgList<T>& save ( const char *const filename, const int number = -1 ) const`

Save an image list into a file.

Depending on the extension of the given filename, a file format is chosen for the output file.

**8.4.2.7** `const CImgList<T>& save_gzip_external ( const char *const filename ) const`

Save a file in TIFF format.

Save an image list as a gzipped file, using external tool 'gzip'.

**8.4.2.8** `static const CImgList<T>& font ( const unsigned int font_height, const bool variable_size = true ) [static]`

Return a [CImg](#) pre-defined font with desired size.

**Parameters**

*font\_height* = height of the desired font (exact match for 11,13,17,19,24,32,38,57)

*fixed\_size* = tell if the font has a fixed or variable width.
